Table of Contents

Chapter 1: Introduction

1.1 Scope	1-1
1.2 Summary of the Contents	1-1
1.3 Notations and Conventions	1-2
1.3.1 Mnemonics	1-2
1.3.2 Numeric Representations	1-2
1.3.3 Register Description Format	1-3
1.3.4 Acronyms	1-3

Chapter 2: Overview and Memory Mapping

2.1 Register Classification	2-1
2.1.1 Setup and Control Registers	2-2
2.1.2 Accelerator CRTC and DAC Registers	2-2
2.1.3 Draw Engine Trajectory Registers	2-3
2.1.4 Draw Engine Control Registers	2-3
2.1.5 Bus Mastering Registers	2-4
2.1.6 AGP Registers	2-4
2.1.7 LCD Panel Registers	2-4
2.1.8 PCI Configuration Space Registers	2-4
2.1.9 VGA Registers	2-4
2.2 Memory Mapping	2-5
2.2.1 Mapping Model	2-6
2.2.2 Accessing Bytes, Words, and Dwords	2-7
2.2.3 Non-Intel Based Memory Mapping	2-8
2.3 Mapping Modes	2-8
2.3.1 Linear Aperture Mapping	2-8
2.3.2 VGA Aperture Mapping	2-11
2.4 Determining Mapped Addresses	2-12
2.4.1 Memory Address	2-12
2.4.2 I/O Base Address	2-14
2.4.3 Absolute I/O Address	2-14

Chapter 3: Cross-Reference Tables

3.1 Using the Tables	3-1
3.1.1 Table Notations:.....	3-1
3.2 Listings of Main Registers.....	3-2
3.2.1 Registers listed by Offset Address.....	3-2
3.2.2 Registers listed by Mnemonic	3-9
3.3 Listings of Indexed Registers	3-15
3.3.1 PLL Registers Sorted by Address.....	3-15
3.3.2 PLL Registers Sorted by Mnemonic.....	3-16
3.3.3 LCD Panel Registers Sorted by Index Number.....	3-18
3.3.4 LCD Panel Registers Sorted by Mnemonic.....	3-20

Chapter 4: Display and Configuration

4.1 Setup and Control Registers	4-1
4.1.1 General I/O Control Registers	4-1
4.1.2 Scratch Pad Registers.....	4-3
4.1.3 Bus Control Registers	4-5
4.1.4 Memory Buffer Control Registers	4-9
4.1.5 Power Management Mode Registers (for RAGE XL/XC only).....	4-12
4.1.6 Memory Control Registers	4-14
4.1.7 Test and Debug.....	4-25
4.1.8 Configuration Registers.....	4-33
4.1.9 Custom Macro Registers	4-38
4.2 Accelerator CRTC and DAC Registers.....	4-39
4.2.1 Accelerator CRTC Registers	4-39
4.2.2 Shadowed and Second CRTC Registers	4-39
4.2.3 Overscan Registers.....	4-59
4.2.4 Hardware Cursor Registers.....	4-62
4.2.5 GenLocking (CRT-Sync to Video) Registers.....	4-65
4.2.6 Clock Control Registers	4-68
4.2.7 PLL Control Registers.....	4-69
4.2.8 DAC Control Registers	4-94

Chapter 5: GUI Draw Engine

5.1 Draw Engine Trajectory Registers.....	5-1
5.1.1 Destination Trajectory Registers	5-1
5.1.2 Source Trajectory Registers.....	5-21
5.2 Draw Engine Control Registers	5-32

5.2.1	Host Data Registers	5-32
5.2.2	Pattern Registers.....	5-34
5.2.3	Scissors	5-38
5.2.4	Data Path Registers	5-42
5.2.5	Color Compare Registers.....	5-60
5.2.6	Command FIFO Registers	5-62
5.2.7	Draw Engine Composite Control Registers.....	5-65
5.2.8	Draw Engine Status Registers.....	5-68

Chapter 6: Host Interface

6.1	PCI Configuration Space Registers.....	6-1
6.2	Bus Mastering Registers.....	6-11
6.2.1	System Bus Mastering Registers.....	6-11
6.2.2	Draw Engine Bus Mastering Registers.....	6-12
6.3	AGP Registers.....	6-15

Chapter 7: VGA-Compatible Registers

7.1	VGA Compatible Registers Summary – By I/O Port.....	7-1
7.2	VGA CRT Controller Registers.....	7-5
7.3	VGA Attribute Controller Registers.....	7-17
7.4	General VGA Status and Configuration Registers.....	7-22
7.5	VGA Sequencer Registers	7-25
7.6	VGA DAC Registers.....	7-29
7.7	VGA Graphics Controller Registers.....	7-30

Chapter 8: LCD Panel

8.1	Index and Data Registers	8-1
8.2	Configuration and Timing Registers	8-3
8.3	LCD General Control Registers	8-6
8.4	Dual Scan Panel Control Registers.....	8-8
8.5	Half Frame Buffer Registers.....	8-10
8.6	Horizontal and Vertical Stretching Registers.....	8-11
8.7	LT_GPIO and ZVGPIO Registers	8-14

Table of Contents

8.8 Power Management Registers 8-17

8.9 Hardware Icon Registers 8-22

8.10 TMDS Registers 8-26

 8.10.1 TMDS Encoder Registers..... 8-26

 8.10.2 TMDS Testblock Registers 8-28

 8.10.3 TMDS Transmitter Macro Registers..... 8-31

8.11 APC Registers..... 8-33

Chapter 1

Introduction

1.1 Scope

This document is a reference guide for the registers used in the RAGE XL/XC product.

1.2 Summary of the Contents

The following table summarizes the chapters used in this document.

Table 1-1 A Summary of the Chapters

Chapter	Description or Contents
Chapter 1	An outline of the manual. Explains notations and conventions.
Chapter 2	An overview of the registers. Describes the memory and I/O mapping.
Chapter 3	A cross-reference summary of the registers. Two tables list the registers by register name (mnemonic) and by register address. To help quickly locate a specific register, both tables use a page number column. This column is hypertext linked for the on-line document.
Chapter 4	2D accelerator registers Setup and control registers Accelerator CRTC and DAC registers
Chapter 5	GUI engine registers
Chapter 6	Host interface registers PCI configuration space registers System bus mastering registers Draw engine bus mastering registers AGP registers
Chapter 7	VGA-compatible registers
Chapter 8	LCD panel registers

1.3 Notations and Conventions

1.3.1 Mnemonics

Mnemonics are expressed in upper-case and are used throughout this document in place of hardware register names and field names. The naming conventions for registers and bit fields are as indicated below:

Table 1-2 Explanation of the Mnemonic Nomenclature

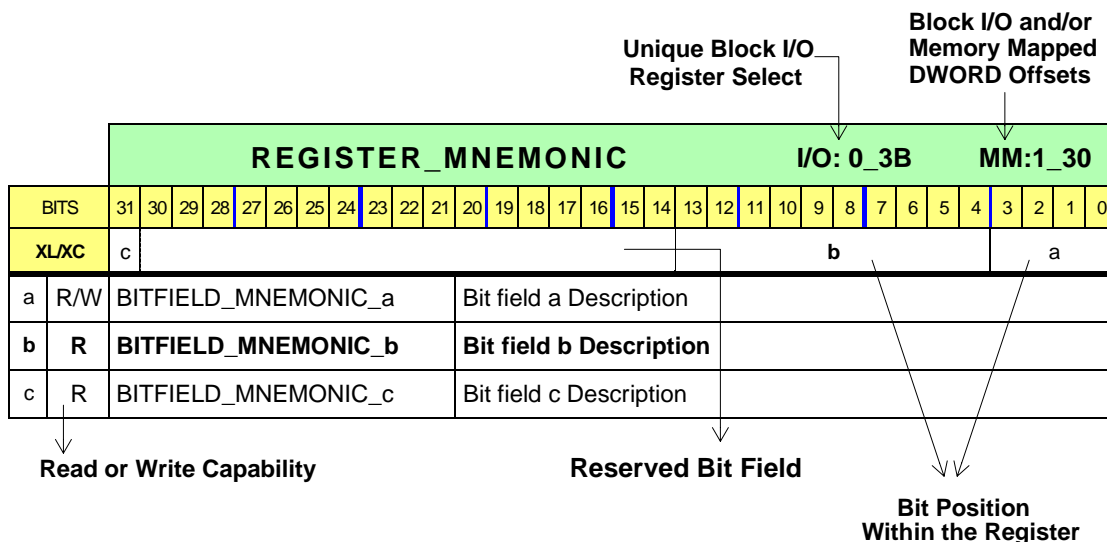

Mnemonic Nomenclature	Example and Explanation
REGISTER_MNEMONIC	CONFIG_CHIP_ID The register mnemonic for the Configuration Chip ID register.
REGISTER_MNEMONIC[bit#:bit#]	CONFIG_CHIP_ID[15:0] [15:0] is the bit field that occupies bit positions 0 through 15 within the CONFIG_CHIP_ID register.
FIELD_NAME@REGISTER_MNEMONIC	CFG_CHIP_TYPE@CONFIG_CHIP_ID An alternative to the above mnemonic (CONFIG_CHIP_ID[15:0]). Instead of providing the bit positions, this example gives the field name CFG_CHIP_TYPE (Product Type Code).

1.3.2 Numeric Representations

- Hexadecimal numbers are appended with “h” whenever there is a risk of ambiguity. Other numbers are assumed to be in decimal.
- Several signals of identical function are sometimes described by a single expression in which the part of the signal name that differs is shown in parentheses []. For example, the four Select signals—SEL0#, SEL1#, SEL2#, and SEL3#—are represented by the single expression SEL[0-3]#.

1.3.3 Register Description Format

All registers in this document are described in the same or similar format as shown by the self-explained sample below.

1.3.4 Acronyms

Standard acronyms or abbreviations used in the literature are presumed known and therefore freely used without any explanation. When in doubt, refer to the following table below. Less frequently used or ATI-specific acronyms will be accompanied by the full expression when it appears for the first time in the document.

Table 1-3

Acronym	Full Expression
AGP	Accelerated Graphics Port
AMC	ATI Multimedia Channel
BIOS	basic input/output system
bpp	bits per pixel
DAC	digital-to-analog converter
EDO RAM	Extended Data Output RAM
FIFO	first in first out
GUI	graphical user interface

Table 1-3 Cont'd

Acronym	Full Expression
I ² C	inter IC communication
I/O	input/output
MPEG	Motion Picture Experts Group
MPP	Multimedia Peripheral Port
PCI	Peripheral Component Interconnect
PLL	phase-locked loop
POST	power-on self-test
RAMDAC	RAM digital-to-analog converter
RGB	red-green-blue (may refer to a color encoding scheme or a video signal)
R/W	read/write
SDRAM	Synchronous DRAM
SGRAM	Synchronous Graphics RAM
VGA	Video Graphics Array
YUV	A color encoding scheme, no direct correspondence to the letters

Chapter 2

Overview and Memory Mapping

2.1 Register Classification

For ease of discussion and reference, the registers are grouped into the following main classes according to their functionality:

- Setup and Control registers
- Accelerator CRTIC and DAC registers
- GUI registers
- Bus Mastering registers
- AGP registers
- LCD Panel registers
- PCI Configuration Space registers
- VGA registers

These are general register classes only. There may be instances when specific bit fields of the same register may belong to a different class register. When this happens, it is noted in the register description.

Only registers in the first nine classes are tabulated in Chapter 3. To view the contents of the PCI and VGA registers, refer to Chapters 6 and 7 respectively.

The following is an overview of all the registers. Some classes are further divided into sub-groups.

2.1.1 Setup and Control Registers

These registers are memory mapped and aliased at an I/O address. Most of these registers are initialized only once at boot time. They are divided into the following sub-groups:

Table 2-1 Sub-groups for the Setup and Control Register

Sub-group	Purpose
General I/O Control	Configuring the General Purpose I/O pins on the accelerator chip.
Scratch Pad	General-purpose storage for the adapter ROM and for communicating the adapter ROM segment location to host applications. In test modes, these registers are used for chip diagnostics.
Bus Control	Configuring the on-chip bus interface unit.
Memory	Configuring the memory interfaces.
Test and Debug	Chip diagnostics and hardware debugging.
Configuration	Configuring the aperture and to read the current board configuration.
Custom Macros	Setting up custom macros.

2.1.2 Accelerator CRTC and DAC Registers

These registers are memory mapped and aliased at an I/O address. The accelerator CRTC registers are not the same as the VGA CRTC registers. They are divided into the following sub-groups:

Table 2-2 Sub-groups for the Accelerator CRTC and DAC Registers

Sub-group	Purpose
Overscan	Configuring the overscan borders.
Hardware Cursor	Defining and moving the hardware cursor.
Genlocking	Synchronizing the CRT with the video source.
Clock Control and PLL	Configuring the pixel clock.
DAC Control	Configuring the DAC.

2.1.3 Draw Engine Trajectory Registers

These registers are memory mapped. They set up the source and destination trajectories and initiate draw operations. They are divided into the following sub-groups:

Table 2-3 Sub-groups for the Draw Engine Trajectory Registers

Sub-group	Purpose
Destination Trajectory	Defining the region in which pixels are drawn. The region may be a a line, a rectangular, or a trapezoidal area.
Source Trajectory	Defining a rectangular region from which pixel data is taken. The pixel data may be used as a monochrome or color pixel source, or a polygon fill mask.

2.1.4 Draw Engine Control Registers

These registers are memory mapped. They set up the source pixel data, the draw engine data path, and the destination mixing logic. They are divided into the following sub-groups:

Table 2-4 Sub-groups for the Draw Engine Control Registers

Sub-group	Purpose
Host Data	Transferring data from the host to the draw engine.
Pattern	Enabling and defining fixed patterns.
Scissor	Defining a draw region.
Data Path	Configuring the data path and ALU.
Color Compare	Configuring the source or destination color compare.
Command FIFO Status	Reporting the status of the command FIFO.
Draw Engine Composite Control	Abbreviated composites of other draw engine control registers.
Draw Engine Status	Reporting the current state of the draw engine.

2.1.5 Bus Mastering Registers

The *RAGE XL/XC* provides full support for bus mastering to and from system memory. In other words, it is capable of reading system memory and transferring data to the frame buffer as well as writing frame buffer memory out to system memory. Bus mastering operations are invoked either through the bus master system table or via the GUI Draw Engine.

Table 2-5 Sub-groups for the Bus Mastering Registers

Sub-group	Purpose
Draw Engine Bus Mastering	Specifying register address/data for bus mastering operations invoked through the Draw Engine.
System Bus Mastering	Controlling and determining the status of all the bus mastering operations.

2.1.6 AGP Registers

These registers configure the Accelerated Graphic Port.

2.1.7 LCD Panel Registers

These registers configure the LCD panel.

2.1.8 PCI Configuration Space Registers

The PCI Configuration Space registers determine the host bus configuration during system reset. For the *RAGE XL/XC*, the internal Host Bus interface has been optimized to support the PCI Version 2.1 bus configuration, providing full 32-bit memory and I/O operations.

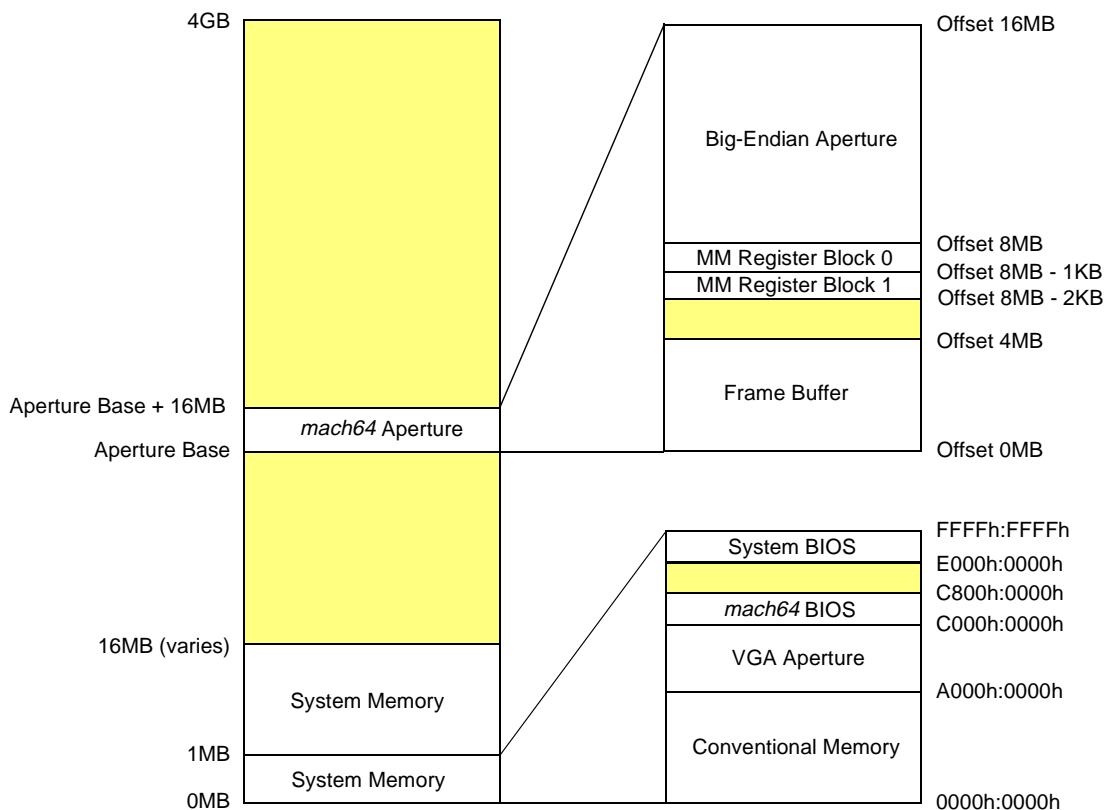

2.1.9 VGA Registers

The VGA registers provide register-level compatibility with the IBM VGA display adapter. They and the accelerator registers are completely segregated from each other, and their functions are mutually exclusive.

Note that the ATI VGA extended registers, available with the *mach64* GX family (through 1CEh to 1CFh), are no longer included in the *RAGE XL/XC*.

2.2 Memory Mapping

The RAGE XL/XC uses a fully memory mapped programming model. All registers (except DAC_REGS, which is made up of a group of four 8-bit registers) are 32-bit wide and numbered from 0h to FFh. They are memory mapped into two 1K-blocks — block '0' and block '1', as shown in the figure below.

Aperture Base address can be located anywhere in the shaded region and is aligned to a multiple of 16MB.

Figure 2-1 Typical Organization of Aperture Within Host Address Space

2.2.1 Mapping Model

In terms of memory mapping locations, the registers can be grouped into six major categories. The table below summarizes the mapping of the register groups to memory and to the I/O space.

Table 2-6 Register Groups by Memory Mapping

Register Group	I/O Mapping	Memory Mapping	Comments
PCI configuration	No	No	Accessed with configuration cycles
VGA	Yes	No	VGA standard addresses
Display and Configuration	00h to 3Fh	0_00h to 0_3Fh	Same offset for I/O and memory
GUI	No	0_40h to 0_FFh	Memory mapped only
Multimedia registers	Some in 00h to 3Fh	1_00h to 1_FFh	Some selected registers in I/O space, but different offsets for I/O and memory
PLL	24h	0_24h	Accessed indirectly through CLOCK_CNTL register

- The PCI POS registers exist only in the PCI configuration space.
- VGA registers are mapped to the standard VGA addresses in the I/O space.
- The Accelerator registers (non-VGA) use apertures in both I/O and memory space. All accelerator registers are visible in the memory space, but only a subset is mapped to the I/O space.
- All 2D and 3D draw engine registers are memory mapped to Block '0', with Dword offsets between 40h and FFh inclusive. These registers are written through a command FIFO and are read directly.
- The multimedia registers are memory mapped to Block '1', with Dword offsets between 00h and FFh inclusive. Some selected multimedia registers also appear in the I/O space, but with different offsets for I/O and memory.
- The PLL registers are accessed indirectly through the CLOCK_CNTL register.

Registers not associated with the 2D and 3D draw engines and multimedia are generally used for display and configuration purposes. These registers, numbered from 00h to 3Fh, can be directly readable and writable. In addition to being memory mapped, they are also mapped into a single continuous I/O block (referred to as "block" or "re-locatable" I/O) which starts at the I/O base address specified in the PCI Configuration registers. This

allows the registers to be accessed at I/O addresses aliased to offsets from the base I/O address. For block I/O, the I/O base address can be located anywhere within the 64K I/O space.

Note that Sparse I/O decoding is **not** supported by the RAGE XL/XC.

2.2.2 Accessing Bytes, Words, and Dwords

The table below indicates which register groups may be accessed as bytes, words, or Dwords.

Table 2-7 Register Accessing Sizes

Register Group	Byte Addressing	Word Addressing	Dword Addressing
PCI POS registers	Yes	Yes	Yes
VGA registers	Yes	Note 1	Note 1
Display & Configuration	Yes	Yes, note 2	Yes, note 2
GUI registers	No	No	Yes
Multimedia registers	No, note 3	No, note 3	Yes
PLL registers	Yes	No	No

Notes:

1. If two or four VGA registers are continuous in the I/O space, 16 or 32 cycles may be used. The cycle will be broken up internally into 2 or 4 sequential cycles starting with the lowest address first.
2. The DAC_REGS register is actually four 8-bit registers. Word or Dword cycles will be broken up internally into 2 or 4 sequential cycles starting with the lowest address first.
3. The multimedia registers that appear in I/O space are Dword-only registers. This means 32 bit IN or OUT operations must be used.
4. When trying to access only a byte or word of a 32 bit register, simply add 1, 2 or 3 to the absolute address calculated as shown earlier.
5. It is not recommended to perform word or Dword cycles that span a Dword boundary. This will not work correctly in all cases.

2.2.3 Non-Intel Based Memory Mapping

When incorporating the RAGE XL/XC into a non-Intel platform (such as the Apple Power Macintosh), make sure the platform conforms to the PCI specification. For information on how to configure the RAGE XL/XC in non-Intel environments, refer to Chapter 2 of the *mach64 Programmer's Guide*.

2.3 Mapping Modes

Depending on the system configuration, the RAGE XL/XC operates in either of two selectable register mapping modes – Linear Aperture mode or VGA Aperture mode. The Linear Aperture mode is optimized for PCI configurations, while the VGA Aperture mode is used for backward compatibility to ISA-based systems. The Linear Aperture mode requires that the Linear Aperture be enabled, while the VGA aperture mode requires that the VGA portion of the chip be enabled. All registers are mapped relative to the top of the defined memory aperture.

2.3.1 Linear Aperture Mapping

In Linear Aperture mode, a large linear (primary) memory aperture and a small auxiliary register aperture are set up. The primary aperture size is fixed at 2x8 MB, and that of the auxiliary register aperture is 4 KB. The latter is used exclusively for register access (no mapping to the frame buffer) and is always enabled.

Primary Aperture

This aperture maps the entire frame buffer into the system memory address space. The memory mapped registers are optionally visible at the top of the first 8 MB of the primary linear aperture.

The aperture position is set by the system BIOS at configuration time through the Base Address registers in the PCI configuration space (see [Chapter 6](#)). The aperture size and position can also be read from the read-only *CONFIG_CNTL* register.

For the primary aperture, register Block '0' (CT-compatible block) is located in the top 1K of the first 8 MB, and register Block '1' (multimedia extensions) is 1K below Block '0'. The figure below shows the positions of register Block '0' and register Block '1' in a typical primary aperture configuration.

Figure 2-2 Primary Linear Aperture Register Map

The table below defines the register block offset within the linear aperture. “N/A” indicates that the registers are not visible with those settings. Reads or writes to those addresses will go to the frame buffer memory.

Table 2-8 Register Block Offsets

BUS_APER_REG_DIS @BUS_CNTL	BUS_EXT_REG_EN @BUS_CNTL	Register Block 0 Offset	Register Block 1 Offset
1	X	N/A	N/A
0	0	7FFC00	N/A
0	1	7FFC00	7FF800

Auxiliary Aperture

The auxiliary register aperture is permanently enabled and available. All the registers in this aperture are mapped to the same offset as the primary linear register aperture (at the top of the first 8MB of the linear aperture). This aperture can be used in place of the primary aperture. The purpose of this auxiliary register aperture is to allow the primary aperture to be disabled to enable access to the frame buffer memory mapped behind the memory-mapped registers. In this way, the auxiliary and the primary apertures are independent of each other.

The memory map of the auxiliary aperture is shown in the figure below:

Figure 2-3 Auxiliary Register Aperture Memory Map

Note: In the auxiliary register aperture, the base of Block '1' is always at offset 0 and the base of Block '0' is always at offset 400h. The upper 2K of the aperture is reserved. This allows the register aperture to be 4K-aligned.

2.3.2 VGA Aperture Mapping

The VGA registers are completely segregated from the Accelerator registers. They provide compatibility with the IBM VGA Display Adapter. VGA apertures are 64K or 128K for standard VGA modes. VGA registers are I/O mapped only (with absolute addresses given in the descriptions in Chapter 9). They cannot be moved or configured.

The VGA aperture is fixed between A0000h and BFFFFh, and the VGA I/O space is fixed at these locations — 102h, 46E8h (and some aliases), 3C0h through 3CFh (except 3CBh and 3CDh), 3B4h and 3B5h for monochrome display or 3D4h and 3D5h for color display.

In VGA aperture mode, the upper 1KB (or 2KB) of the 128KB aperture is reserved for the controller register space. The Graphics Miscellaneous Register (a VGA register) has two bits (GRPH_ADRSEL) that control which part of the VGA aperture is enabled. The register mapping can only occur when the entire 128KB aperture is enabled, or just the top 32KB is enabled. The other two cases do not include the area from BF800h to BFFFFh, and therefore can not map the registers.

Figure 2-4 VGA Aperture Memory Map

The following table indicates the various bits that must be set to enable register mapping

into the VGA aperture.

Table 2-9 Mapping into the VGA Aperture

CFG_MEM_VGA_AP_EN @CONFIG_CNTL	BUS_EXT_REG_EN @BUS_CNTL	GRPH_ADRSEL @GRA06	Register Block 0 Base	Register Block 1 Base
0	X	XX	N/A	N/A
X	X	01 or 10	N/A	N/A
1	0	00 or 11	BFC00	N/A
1	1	00 or 11	BFC00	BF800

2.4 Determining Mapped Addresses

2.4.1 Memory Address

The notation for the block/Dword offset (see cross-reference tables in Chapter 3) is

MM: block#_offset, where:

MM denotes memory mapped

block# identifies the block that the register belongs to (0 or 1)

offset identifies the register Dword offset *within* the associated block, in hexadecimal

For example, the OVERLAY_SCALE_CNTL register address, given by **MM: 1_09**, indicates that this register is located in register Block ‘1’ (2K below the top of the graphics aperture) at Dword offset 9h. The Dword offset is converted to a byte offset by multiplying it by 4 (i.e., Dword offset 9h is byte offset 24h).

Note: For non-VGA registers, which are visible in both I/O and memory space, **MM** is replaced by **I/O**.

Absolute Register Address

The memory mapped registers are visible at the top of the first 8MB of the linear aperture. With the base of the aperture located at 8 MB in memory, the absolute primary aperture register address is calculated using the formula:

$$\text{Absolute register address} = (\text{aperture_base_address}) + (\text{reg_block_offset}) + (\text{reg_byte_offset})$$

Relative Register Address

The relative register address (to the base of the primary linear aperture) is calculated using the formula:

$$\text{Relative register address} = \text{register block offset} + \text{register byte offset}$$

For example, for register (OVERLAY_SCALE_CNTL):

aperture base address = 800000h
register block 1 offset = 7FF800h
register byte offset = 24h (4*Dword offset)
Absolute register address = FFF824h
Relative register address = 7FF824h

Auxiliary Aperture Register Address

An auxiliary aperture register address is calculated by:

$$\text{auxiliary register address} = (\text{aperture_base_address}) + (\text{reg_block_offset}) + (\text{reg_byte_offset})$$

For example:

aperture base address = C00000h
register Block 1 offset = 0h
register byte offset = 24h (4*Dword offset)
Absolute register address = C00024h

VGA Aperture Register Address

A VGA aperture register address is calculated by:

$$\text{Aperture register address} = (\text{register_block_base}) + (\text{reg_byte_offset})$$

For example:

register Block 1 base = BF800h
register byte offset = 24h (4*Dword offset)
Absolute register address = BF824h

Note: All register offsets that are **not** preceded by a block number are assumed to be in Block '0'.

2.4.2 I/O Base Address

As mentioned earlier, all display and configuration registers not associated with the 2D/3D draw engines or multimedia are I/O mapped and have memory mapped register aliases.

To support block I/O register mapping, the RAGE XL/XC requests a 256 byte I/O aperture, thus allowing 64 I/O mapped registers. The registers are mapped into this continuous block, starting at the I/O base address specified in the PCI configuration registers (summarized in [Chapter 6](#)).

Since the I/O base address may be different depending on the card configuration, it cannot be assumed to be of a specific value. The easiest way to obtain the I/O base address is to call the *mach64* BIOS function 12h (see [Appendix A - BIOS Services](#), of the *mach64 Programmer's Guide* for more information).

For block I/O, the I/O base address can be of any value within a 64KB I/O space. The value is decided by the system to insure that no conflicts exist and is in accord with the Plug and Play (PnP) specification. Refer to Chapter 2 of the *mach64 Programmer's Guide* for more information on how to use this function call.

2.4.3 Absolute I/O Address

For display and configuration registers not associated with the 2D/3D draw engines or multimedia, the block I/O offset is given as the Dword offset (**Offset**) from the memory mapped register base address and the block I/O base address.

For block I/O, the equation for determining the Absolute I/O address is:

$$\text{Absolute I/O address} = (\text{Dword Offset} * 4) + \text{I/O base address}$$

Using SCRATCH_REG1 as an example, the Dword offset is given by **Offset: 0_21**. This indicates that the register is located in register Block '0' at Dword offset 21h. The Dword offset is converted to a byte offset by multiplying by 4 (therefore, Dword offset 21h is byte offset 84h). If the I/O base address = E000h and the Dword offset = 21h, the physical I/O address will be E084h.

For some I/O registers, it is necessary to access individual bytes within the 32-bit register (for example, DAC_REGS, which is actually four 8-bit registers). In those cases, the Dword offset should be converted to a byte offset before adding the individual byte offset (0, 1, 2, or 3).

As an example, the procedure to access the DAC_MASK byte of DAC_REGS is shown below.

$$\begin{aligned} \text{byte offset} &= \text{Dword Offset} * 4 = 30\text{h} * 4 = \text{C0h (DAC_REGS)} \\ \text{individual byte offset} &= 2 \text{ (DAC_MASK byte)} \\ \text{I/O base address} &= \text{E000h} \\ \text{Absolute I/O address} &= \text{byte offset} + \text{individual byte offset} + \text{I/O base address} \\ &= \text{C0h} + 2 + \text{E000h} = \text{E0C2h} \end{aligned}$$

Chapter 3

Cross-Reference Tables

3.1 Using the Tables

This chapter comprises two main register summary tables, followed by six sub-tables. The two main tables list all but the PCI POS and the VGA Controller registers, which are covered in Chapters 6 and 7 respectively. The first table lists the registers by address while the second by mnemonic. The six sub-tables list the indexed PLL and LCD, with each group also sorted in two ways.

The tables in this chapter offer a convenient way to locate the full description of any of the registers contained in Chapters 4, 5 and 8, and some (excluding the PCI registers) contained in Chapter 6. If you are using the online version of this document, the page numbers are hypertext linked to the register descriptions.

3.1.1 Table Notations:

- A tick (✓) in the column under the heading *Block I/O* indicates that the register is aliased at an I/O address.
- The (*h*) in the *DWORD Offset* column heading indicates that numerals are in hex.
- *R/W* means read and write, *R* means read only, and *W* means write only.

3.2 Listings of Main Registers

dd	R/W	I2C_IO_DRIVE											I2C I/O output drive strength Applies to GPIO pins 12 and 13 0 = No boost 1 = Boost																				

Description

This register specifies the data and direction for pins GPIO[13:0] of the General Purpose I/O bus. For the data/direction of pins GPIO[46:44], refer to register [LT_GPIO](#).

Usage

For details on the typical pin configurations used to support the various operational modes (VFC, DVS, etc.), refer to the RAGE XL/XC Graphics Controller Specifications.

4.1.2 Scratch Pad Registers

		SCRATCH_REG0																Offset: 0_20															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		a																															
a	R/W	SCRATCH_REG0											Scratch pad 0																				

Description

This register is a general-purpose, scratch-pad, storage register. Use these registers to allow two decoupled programs to exchange information. Typically, these registers are used by the BIOS to pass configuration information to drivers or used for BIOS data storage.

Usage

Only the adapter BIOS should use this register.

4.1.3 Bus Control Registers

		BUS_CNTL																Offset: 0_28															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		x	w	v	u	t	s	r	q	p	o	n	m		l		k		j					i		h	g	f	e	d	c	b	a
a	R/W	BUS_DBL_RESYNC																Add 1 clock-settling time to BCLK and MCLK re-synchronizers: (default = 1)															
b	W	BUS_MSTR_RESET																To reset the bus master, write a '1' to this bit (one shot, no need to write '0')															
c	W	BUS_FLUSH_BUF																To flush data from the buffer, write a '1' to this bit (one shot, no need to write '0')															
d	R/W	BUS_STOP_REQ_DIS																Disable the burst read requests after stop has been asserted: (default = 0) 0 = Normal operation 1 = Disable															

Cont'd		BUS_CNTL																Offset: 0_28															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		x	w	v	u	t	s	r	q	p	o	n	m	l			k	j		i			h	g	f	e	d	c	b	a			
e	R/W	BUS_APER_REG_DIS											Disable memory-mapped register decoding in the linear aperture: (default = 0) 0 = Enable 1 = Disable																				
f	R/W	BUS_EXTRA_PIPE_DIS											Disable extra pipeline stage: (default = 0) 0 = Enable 1 = Disable																				
g	R/W	BUS_MASTER_DIS											Disable bus master operation: 0 = Enable 1 = Disable																				
h	R/W	ROM_WRT_EN											Enable write to flash memory BIOS: (default = 0) 0 = Disable 1 = Enable (ROMWRTEN strap must also be enabled)																				
i	R	MINOR_REV_ID											Additional minor revision ID bits (read only) from A31 version on.																				
j	R/W	BUS_PCI_READ_RETRY_EN											Enable retry for PCI read transfers: (default = 0) 0 = Normal operation (reads will hold bus until complete) 1 = Enable retry cycle in PCI (reads will retry when timeout counter expires)																				
k	R/W	BUS_PCI_WRT_RETRY_EN											Enable retry for PCI write transfers: (default = 0) 0 = Normal operation (writes will hold bus until complete) 1 = Enable retry cycle in PCI (writes will retry when timeout counter expired)																				
l	R/W	BUS_RETRY_WS											Control value for timeout counter.																				
m	R/W	BUS_MSTR_RD_MULT											Enable 'read multiple' command for bus master: (default = 0) 0 = When transfer length greater than cache line size reg., use 'read line' command 1 = When transfer length greater than cache line size reg., use 'read multiple' command																				
n	R/W	BUS_MSTR_RD_LINE											Set the 'read line' command for bus master: (default = 0) 0 = Use 'read' command exclusively 1 = When transfer length greater than 1, use 'read line' command																				
o	R/W	BUS_SUSPEND											Set mode for current bus master transfer 1 = Suspend (this transfer will resume when this bit is cleared) 0 = Resume																				
p	R	LAT16X											Set value of the latency timer 1 = Multiply the latency timer value by 16 0 = Use the latency timer value as is																				

Cont'd		BUS_CNTL																Offset: 0_28															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

q	R/W	BUS_RD_DISCARD_EN											Enable PCI slave read data: (default = 0) 1 = Enable 0 = Disable																				
r	R/W	BUS_RD_ABORT_EN											Enable the slave's delayed read transaction abort (for BM conflicts) 1 = Enable 0 = Disable																				
s	R/W	BUS_MSTR_WS											Number of wait states to allow until bus master transaction is terminated: 0 = 8 wait states 1 = 32 wait states Note: This is valid only when BUS_MSTR_DISCONNECT_EN is enabled																				
t	R/W	BUS_EXT_REG_EN											Enable extended register block 1: (default = 0) 0 = Disable 1 = Enable																				
u	R/W	BUS_MSTR_DISCONNECT_EN											Enable bus master disconnect after allowed wait states has elapsed: (default = 0) 1 = Enable 0 = Disable																				
v	R/W	BUS_WRT_BURST											Enable burst write transfers: (default = 0) 0 = Disable 1 = Enable																				
w	R/W	BUS_READ_BURST											Enable burst read transfers: (default = 0) 0 = Disable 1 = Enable																				
x	R/W	BUS_RDY_READ_DLY											Set delay for the bus memory read RDY signal: (default = 1) 0 = No delay 1 = Delay RDY by 1 memory clock																				

Description

This register configures the on-chip bus interface, controls the bus mastering, and controls the error condition interrupts.

Usage

Error condition flags that generate hard interrupts should be used only for software debugging and not included in the final retail software.

Other control bits in this register should be used only by the adapter ROM at boot-time.

Table 4.2 specifies conversion of the BUS_RETRY_WS field into actual wait states on BCLK when BUS_PCI_WRT_RETRY_EN = 1 or BUS_PCI_READ_RETRY_EN = 1.

Table 4-1 Conversion of the BUS_RETRY_WS Field

BUS_RETRY_WS	Actual Number of Clocks to TRDY or STOP	Time (@33 MHz)
0	3	90 ns
1	5	150 ns
2h	7h	210 ns
3h	8h	240 ns
4h	9h	270 ns
5h	Bh	330 ns
6h	Eh	420 ns
7h	Fh	470 ns
8h	13h	570 ns
9h	35h	1.59 ms
Ah	57h	2.61 μs
Bh	78h	3.6 μs
Ch	99h	4.59 μs
Dh	BBh	5.61 μs
Eh	FFh	7.65 μs
Fh	Infinite	Infinite

Note: First dataphase response = 8 clks + actual clocks from the above table.

BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		e		d								c		b				a															
e	R/W	PM_DSP_RW_SEL																<p>Toggles register access/definition from XCLK display FIFO registers: DSP_CONFIG, DSP_ON_OFF, DSP2_CONFIG, DSP2_ON_OFF, VGA_DSP_CONFIG and VGA_DSP_ON_OFF) to PM_XCLK display FIFO registers (PM_DSP_CONFIG, PM_DSP_ON_OFF, PM_VGA_DSP_CONFIG, PM_VGA_DSP_ON_OFF)</p> <p>These registers share the same offset 0 = Register read/writes go to XCLK version of display FIFO registers (default) 1 = Register read/writes go to PM_XCLK version of display FIFO registers</p>															

4.1.5 Power Management Mode Registers (for RAGE XL/XC only)

This mode is used only in the RAGE XL/XC chip. The power management mode uses the following memory controller registers (denoted by the prefix PM_). To use the slower version of XCLK, referred to as PM_XCLK, set the requester activity in a specific state that is defined by the POWER_MANAGEMENT_2 registers.

The PM_DSP_RW_SEL bit in TIMER_CONFIG will select which display FIFO registers (which share the same offset) to access. For example:

- To assess DSP_ON_OFF, set PM_DSP_RW_SEL=0.
- To access PM_DSP_ON_OFF, set PM_DSP_RW_SEL=1 (for that register offset).

y	R/W	MEM_GROUP_FAULT_EN																Controls page faulting between 2MB groups 0 = Enable 1 = Disable															

Usage

Changes in settings to this register will not take affect until MEM_SDRAM_RESET is pulsed (from 0 →1).

The sequence should be as follows:

1. Write EXT_MEM_CNTL with the desired settings, setting MEM_SDRAM_RESET = 0 (use read/modify/write).
2. Rewrite EXT_MEM_CNTL, setting MEM_SDRAM_RESET = 1.
3. Rewrite EXT_MEM_CNTL, setting MEM_SDRAM_RESET = 0 (clear

reset bit).

In order to reset SDRAM, the following steps must be performed:

1. Set MEM_SDRAM_RESET to '1'
2. Set MEM_CYC_TEST to '10'
3. Set MEM_CYC_TEST to '11'. Wait at least 3ns.
4. Set MEM_CYC_TEST to '00'
5. Set MEM_SDRAM_RESET to '0'

Description

This register configures the on-chip memory interface unit.

Usage

This register is normally configured only by the adapter ROM during the power-up initialization. Applications should touch only the MEM_BNDRY and MEM_BNDRY_EN fields for relocating the memory boundary between the accelerator and VGA.

a	R/W	MEM_VGA_WPS0																Write page pointer for lower 32KB aperture into 8MB video memory.															
b	R/W	MEM_VGA_WPS1																Write page pointer for upper 32KB aperture into 8MB video memory.															

Description

This register contains the two write page pointers used for the two small 32K apertures at 0xA000 and 0xA800. Pages are selectable only on 32K boundaries. These write pages are independent of the read pages.

Usage

This register is needed only when writing to the small apertures. Small apertures are required only if the big linear aperture is not available. The big linear aperture may not be available on ISA configurations.

Apertures exist only in accelerator modes, and only if CFG_MEM_VGA_AP_EN@CONFIG_CNTL is set. VGA apertures are not supported if CFG_BUS_TYPE = PCI. A 4M or 8M linear aperture must be used for PCI bus implementation.

Description

This register is used for general control and diagnostic control. Most of the test modes are only used during ASIC testing or for debugging purposes.

Bit [4] enables the second hardware icon. **(NOT supported)**

Bit [5] enables the second hardware cursor. **(NOT supported)**

Bit [6] (or bit [5] in LCD_GEN_CTRL, backward compatibility) enables the hardware icon. **(NOT supported)**

Bit [7] enables the hardware cursor.

Bit [8] resets the Draw engine.

Bits [19:16] enable various test modes of the ASIC.

Bit [21] enables the cyclic redundancy checkers (CRC and CRC2).

Bits [31:24] enable various debug modes of the ASIC.

Usage

The DAC and memory configuration should be touched only by the adapter BIOS. Similarly, the diagnostic fields should be touched only by the diagnostic programs.

Application level programs should touch only the following bits:

GEN_CUR_ENABLE

For GEN_DEBUG_MODE, it is required to set GPIO_DIR1 through GPIO_DIRA to 1's in order to see the selected debug mode.

d	R/W	VCNTR_LOAD											Vertical count load																				
e	R/W	EOL_STOP											End of line stop																				
f	R/W	EOF_STOP											End of field stop																				

Description

This register affects the CRT controller, but was not put in Block 0 for backward compatibility (there is no block I/O mapping for this register).

Usage

Use this register for ASIC test purposes.

4.1.8 Configuration Registers

		CONFIG_CNTL																Offset: 0_37															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
															d	c						b	a										
a	R	CFG_MEM_AP_SIZE													Linear memory aperture size: (default = 10) 00 = Reserved 01 = Reserved 10 = 2x8MB apertures 11 = Reserved																		
b	R/W	CFG_MEM_VGA_AP_EN													Register mapping to VGA aperture (Default = 0) 0 = Memory mapped registers not in VGA aperture 1 = Memory mapped registers available in VGA aperture																		
c	R	CFG_MEM_AP_LOC													Linear memory aperture location on 16MB boundary (bits 5:0 = 00)																		
d	R/W	CFG_VGA_DIS													Disable VGA: (default = 0) 0 = Enable if CFG_VGA_EN@CONFIG_STAT0 = 1 1 = Disable																		

Description

This register configures the linear memory aperture and for soft configuration of multiple *mach64* systems. The aperture size (CFG_MEM_AP_SIZE) is always set to 2x8 MB, and the location (CFG_MEM_AP_LOC) is fixed by the PCI configuration space (see [Chapter 6](#)). These two fields of the CONFIG_CNTL register are read-only for PCI systems.

Usage

Aperture configuration should be done in the adapter BIOS only, during an aperture service function call. Configuration data is stored in non-volatile memory. Both CFG_CARD_ID and CFG_VGA_DIS are touched only in the adapter ROM on power-up to configure the board for multiple *mach64* usage.

All offset registers are expanded to allow 8 Mb pointers, with 64-bit granularity. Texture map pointers must have byte granularity.

		CONFIG_CHIP_ID																Offset: 0_38															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		e		d		c		b				a																					
a	R	CFG_CHIP_TYPE								Product type code, see DEVICE ID table below																							
b	R	CFG_CHIP_CLASS								Product class code (0x00)																							
c	R	CFG_CHIP_VERSION								ASIC major revision number (0x4)																							
d	R	CFG_CHIP_FOUNDRARY								ASIC foundary (0x4) (TSMC)																							
e	R	CFG_CHIP_REV								ASIC minor revision number (0x0)																							

Description

This register is a read-only register. It returns the revision details of the queried chip. CFG_CHIP_TYPE (Device ID) is an alphanumeric code consisting of two ASCII codes, for example, 4752h denotes GR (see table below).

The Device ID field also appears in the PCI configuration space (see [Chapter 6](#)).

Usage

The 16 bits Device ID for the RAGE XL/XC in the PCI address 2 and CONFIG_CHIP_ID non-GUI register are as follows:

Table 4-4 Device ID

DEVICE ID	Description
4752h (GR)	PCI-33/BGA
4753h (GS)	PCI-33/PQFP
474Dh (GM)	AGP 1X, 2X/BGA
474Eh (GN)	AGP 1X, 2X/PQFP
474Fh (GO)	PCI-66/BGA
4C4Ch (GL)	PCI-66/PQFP

The 8 bits at PCI address 8h are also known as the ASIC ID. The ASIC ID also appears in the CONFIG_CHIP_ID non-GUI register. The following table shows a list of ASIC IDs used to date:

Table 4-5 ASIC ID

ASIC ID	Description
24h	TSMC B11
25h	TSMC B21

4.2 Accelerator CRTC and DAC Registers

4.2.1 Accelerator CRTC Registers

The registers in this group generate the horizontal sync, vertical sync, and blank signals used to position the pixel data on the display monitor. All horizontal parameters are in terms of characters (*8 pixels). All vertical parameters are in terms of lines. Accurate display centering is possible by adjusting CRTC_HORZ_SYNC_DLY. A vertical blank and vertical line interrupt allows video synchronization without motion tearing artifacts. Monitor power management is controlled through CRTC_HSYNC_DIS and CRTC_VSYNC_DIS.

4.2.2 Shadowed and Second CRTC Registers

The shadow CRTC registers are controlled by the following bits inside the LCD_GEN_CTRL register:

- CRTC_RW_SELECT, SHADOW_RW_EN, USE_SHADOW, USE_SHADOWED_ROWCUR, USE_SHADOWED_VEND

Shadowed VGA CRTC Registers			
Name	I/O	Index	Bits Shadowed
Horizontal Total	03?5*	0	7:0
Horizontal Display Enable End	03?5*	1	7:0
Start Horizontal Blanking	03?5*	2	7:0
End Horizontal Blanking	03?5*	3	6:0
Start Horizontal Retrace	03?5*	4	7:0
End Horizontal Retrace	03?5*	5	7:0
Vertical Total	03?5*	6	7:0
CRTC Overflow	03?5*	7	7:5, 3:0
Maximum Scan Line	03?5*	9	5:0
Cursor Start	03?5*	A	4:0
Cursor End	03?5*	B	4:0
Start Vertical Retrace	03?5*	10	7:0
End Vertical Retrace	03?5*	11	3:0
Vertical Display Enable End	03?5*	12	7:0
Underline Location	03?5*	14	4:0
Start Vertical Blanking	03?5*	15	7:0
End Vertical Blanking	03?5*	16	7:0
CRT Mode	03?5*	17	2 (forced to 0) Still read back as 1 if written

Note that the CRTC base address will be 3B4 or 3D4 depending on the I/O Address Select field in the GENMO (Miscellaneous Output Register, 3C2).

Shadowed Accelerator CRTC Registers			
Name	Offset	Bits Shadowed	Description
CRTC_H_TOTAL_DISP	0	24:16, 8:0	Horizontal display total and display end
CRTC_H_SYNC_STRT_WID	1	20:16, 12, 10:0	Horizontal sync start and width
CRTC_V_TOTAL_DISP	2	26:16, 10:0	Vertical display total and display end
CRTC_V_SYNC_STRT_WID	3	20:16, 10:0	Vertical sync start and width
CRTC_VLINE_CRNT_VLINE	4	26:16, 10:0	Current vertical line and vertical line interrupt

The access and the usage of the shadowed CRTC registers are controlled by the following bits inside the LCD_GEN_CTRL register: CRTC_RW_SELECT, SHADOW_RW_EN, USE_SHADOW, USE_SHADOWED_ROWCUR, USE_SHADOWED_VEND and DONT_SHADOW_VPAR.

The following tables show how the shadowed registers are used.

CRTC_RW_SELECT	SHADOW_RW_EN	HOST READ/WRITE
0	0	Host read/writes are directed to the non-shadowed CRTC registers
0	1	Host read/writes are directed to the shadowed CRTC registers of the primary CRT
1	don't care	Host read/writes are directed to the secondary CRT's registers

USE_SHADOW	CRTC Registers Used																																									
0	Normal CRTC registers are used instead of the shadowed registers.																																									
1	<p>The following shadowed registers will be used:</p> <table border="1"> <thead> <tr> <th data-bbox="401 305 723 338">Register:</th> <th data-bbox="723 305 1197 338">Bits:</th> </tr> </thead> <tbody> <tr><td data-bbox="401 361 723 387">3?5 index 0</td><td data-bbox="723 361 1197 387">7:0</td></tr> <tr><td data-bbox="401 395 723 421">3?5 index 1</td><td data-bbox="723 395 1197 421">7:0</td></tr> <tr><td data-bbox="401 430 723 456">3?5 index 2</td><td data-bbox="723 430 1197 456">7:0</td></tr> <tr><td data-bbox="401 465 723 491">3?5 index 3</td><td data-bbox="723 465 1197 491">6:0</td></tr> <tr><td data-bbox="401 499 723 526">3?5 index 4</td><td data-bbox="723 499 1197 526">7:0</td></tr> <tr><td data-bbox="401 534 723 560">3?5 index 5</td><td data-bbox="723 534 1197 560">7:0</td></tr> <tr><td data-bbox="401 569 723 595">3?5 index 6</td><td data-bbox="723 569 1197 595">7:0</td></tr> <tr><td data-bbox="401 604 723 630">3?5 index 7</td><td data-bbox="723 604 1197 630">7:5, 3;0</td></tr> <tr><td data-bbox="401 638 723 664">3?5 index 9</td><td data-bbox="723 638 1197 664">5</td></tr> <tr><td data-bbox="401 673 723 699">3?5 index 10</td><td data-bbox="723 673 1197 699">7:0</td></tr> <tr><td data-bbox="401 708 723 734">3?5 index 11</td><td data-bbox="723 708 1197 734">3:0</td></tr> <tr><td data-bbox="401 743 723 769">3?5 index 12</td><td data-bbox="723 743 1197 769">7:0</td></tr> <tr><td data-bbox="401 777 723 803">3?5 index 15</td><td data-bbox="723 777 1197 803">7:0</td></tr> <tr><td data-bbox="401 812 723 838">3?5 index 16</td><td data-bbox="723 812 1197 838">7:0</td></tr> <tr><td data-bbox="401 847 723 873">3?5 index 17</td><td data-bbox="723 847 1197 873">2 (forced to '0'), still reads back '1' if written</td></tr> <tr><td data-bbox="401 881 723 907">CRTC_H_TOTAL_DISP</td><td data-bbox="723 881 1197 907">24:16, 8:0</td></tr> <tr><td data-bbox="401 916 723 942">CRTC_H_SYNC_STRT_WID</td><td data-bbox="723 916 1197 942">20:16, 12,10:0</td></tr> <tr><td data-bbox="401 951 723 977">CRTC_V_TOTAL_DISP **</td><td data-bbox="723 951 1197 977">10:0</td></tr> <tr><td data-bbox="401 986 723 1012">CRTC_V_SYNC_STRT_WID</td><td data-bbox="723 986 1197 1012">20:16, 10:0</td></tr> </tbody> </table>		Register:	Bits:	3?5 index 0	7:0	3?5 index 1	7:0	3?5 index 2	7:0	3?5 index 3	6:0	3?5 index 4	7:0	3?5 index 5	7:0	3?5 index 6	7:0	3?5 index 7	7:5, 3;0	3?5 index 9	5	3?5 index 10	7:0	3?5 index 11	3:0	3?5 index 12	7:0	3?5 index 15	7:0	3?5 index 16	7:0	3?5 index 17	2 (forced to '0'), still reads back '1' if written	CRTC_H_TOTAL_DISP	24:16, 8:0	CRTC_H_SYNC_STRT_WID	20:16, 12,10:0	CRTC_V_TOTAL_DISP **	10:0	CRTC_V_SYNC_STRT_WID	20:16, 10:0

3?5 index A	4:0										
3?5 index B	4:0										
3?5 index 14	4:0										

USE_SHADOWED_VEND	CRTC registers used
0	Normal CRTC registers: 3?5 index 12 or CRTC_V_TOTAL_DISP bits 26:16
1	Shadowed register CRTC_V_TOTAL_DISP bits 26:16 are used as vertical display end

- When the shadowed registers are used to generate the horizontal timing, the bit SEQ_PCLKBY2 (bit 3 of VGA sequencer data register 1) has the following effect on the timing:

SEQ_PCLKBY2	CRTC Registers Used
0	The horizontal timing parameters from the shadowed registers are used as programmed.
1	The contents of the following shadow registers are divided by 2 (by the hardware) before they are used: <ul style="list-style-type: none"> VGA CRTC index 0 bits 7:0 (HTOTAL) VGA CRTC index 1 bits 7:0 (HDISP end) VGA CRTC index 2 bits 7:0 (HBLANK start) VGA CRTC index 3 bits 6:5, 4:0 (HBLANK end) VGA CRTC index 4 bits 7:0 (HSYNC start) VGA CRTC index 5 bits 7, 6:5, 4:0 (HSYNC end)

- When vertical expansion is enabled, the vertical CRT counter will be stalled if a line duplication happens. The vertical display end register should not be shadowed in non-vertical expansion modes to allow maximum VGA compatibility.

When vertical expansion is enabled, the vertical display end register can either be shadowed or non-shadowed.

If the vertical end register is non-shadowed, part of the screen will be missing due to the application programming the vertical end to be greater than the vertical end originally written by the video BIOS.

If the vertical end register is shadowed, applications programming a vertical end value other than 350, 400 and 480 will not work properly. To minimize problems with VGA compatibility, there is an option of not to shadow vertical parameters when expansion is turned on. Based the vertical display end value as well as blank start and end values, hardware will select proper ratio for vertical expansion.

- During simultaneous CRT/LCD display, the shadowed H_SYNC/V_SYNC registers should be used to generate H_SYNC/V_SYNC for the LCD panel while the CRT H_SYNC/V_SYNC should be generated by the non-shadowed CRT H_SYNC/V_SYNC registers. This way, both CRT and LCD timing can be met. If vertical parameters are not shadowed, vertical SYNC for the panel should be generated from non-shadow CRT registers.

Second CRTC Registers

NOTE: The following CRTC2_* registers are NOT supported in RAGE XL/XC.

- Second CRT only supports accelerator mode (no VGA mode support). Ratiometric expansion is not supported. If second CRT is driving LCD panel whose resolution is bigger than current graphics mode, display will be centered. For the second CRT controller, **the following registers are accessible when CRTC_RW_SELECT is set:**

		CRTC_H_TOTAL_DISP																Offset: 0_00															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		b																a															
a	R/W	CRTC_H_TOTAL																Horizontal display total (*8 pixels)															
b	R/W	CRTC_H_DISP																Horizontal display end (*8 pixels)															

Description

This register specifies the horizontal total and horizontal displayed parameters for the accelerator CRTC. This register is used for the first display path.

(*8) means the unit value (in decimal) contained in the bits represents 8 pixels.

Example: to set the CRTC for a total horizontal display of 640 pixels (i.e. a 640x480 display format), insert 50h (i.e., 80 decimal) into bits [8:0]; therefore, $80 * 8 = 640$.

Usage

Use this register only for mode switching, and should be touched only by the adapter BIOS.

d	R/W	CRTC_H_SYNC_WID																Horizontal sync width (*8 pixels)															
e	R/W	CRTC_H_SYNC_POL																Horizontal sync polarity (1 -> active low)															

Description

This register specifies the horizontal sync attributes for the accelerator CRTC. This register is used for the first display path.

(*8 pixels) means the unit value (in decimal) contained in the bits represents 8 pixels. For an complete explanation, refer to CRTC_H_TOTAL_DISP (offset = 0_00).

Usage

Use this register only for mode switching and should be touched only by the adapter BIOS.

		b																a															
a	R/W	CRTC_VLINE																Vertical line at which vertical line interrupt is triggered															
b	R	CRTC_CRNT_VLINE																Current vertical line															

Description

The CRTC_VLINE field determines the line at which a CRTC interrupt will be triggered if the interrupts are enabled. The CRTC_CRNT_VLINE field is read-only and it returns the current value of the accelerator CRTC vertical line counter. This register is used for the first display path.

Usage

Use this register only in applications that require synchronization to the CRTC, such as smooth animation.

a	R/W	CRTC_OFFSET										Display address offset in qword of primary display path																					
b	R	CRTC_OFFSET_LOCK										CRTC display address offset status bit 0 = Indicates CRTC_OFFSET has been used 1 = Indicates CRTC_OFFSET has not been used																					
c	R/W	CRTC_PITCH										Display pitch (*8 pixels) of primary display path																					

Description

This register specifies the starting memory offset and pitch of the accelerator CRTC. This register is used for the first display path. The pitch value must correspond exactly to the destination draw engine pitch for visible screen memory. If the memory boundary is enabled, the offset must be set to a value above or equal to the boundary offset.

(*8 pixels) means the unit value (in decimal) contained in the bits represents 8 pixels. For an complete explanation, refer to CRTC_H_TOTAL_DISP (offset = 0_00).

Usage

The offset register may be used for scrolling and panning on a large desktop if the pitch is set to a value larger than the display resolution. This register may also be used for double buffering applications.

*Two separate writes are required to program this register correctly. The first write should be used to clear the appropriate interrupts (prior to enabling), the second write should then be used to enable the interrupts. Clearing and enabling of interrupts should **not** be attempted in a single write.

Description

This register is used for enabling and acknowledging interrupts generated by the accelerator CRTC, video capture and overlay display, and for reading the status of the CRTC. In RAGE XC, video capture interrupts will not be supported.

Usage

Use this register to achieve smooth animation, or reduce flickering and tearing.

Description

All miscellaneous initialization bits for the accelerator CRTC are contained in CRTC_GEN_CNTL.

CRTC_HSYNC_DIS and CRTC_VSYNC_DIS are used specifically for the Display Power Management System (DPMS).

CRTC_PIX_WIDTH and CRTC_BYTE_PIX_ORDER are used to specify pixel arrangement in memory. These bits correspond exactly to their respective fields in DP_PIX_WIDTH.

CRTC_FIFO_LWM is used only in DRAM configurations. It specifies the emptiness of the display FIFO that must be reached before the CRTC should get more data from memory. There is a lower limit before the display becomes corrupted. The upper limit is 15 because the size of the display FIFO is 16 entries deep. The higher the number, the greater the number of memory page faults. This leads to a decrease in available memory bandwidth, which in turn leads to a slower draw engine.

Usage

Use this register only for mode switching. It should be touched only by the adapter BIOS.

Usage

This register is used to trap all accesses through VGA I/O space to VGA CRTC registers or DAC palette when trapping is enabled.

4.2.3 Overscan Registers

In order to do centering on the high resolution LCD panels, the width for Left, Right, Top and Bottom Overscan is increased (the field names have not changed but their bit sizes have).

Similar to the case of Second CRTC registers, the two Overscan registers, OVER_WID_LEFT_RIGHT and OVER_WID_TOP_BOTTOM, and OVR_CLR are duplicated and accessed using CRTC_RW_SELECT@LCD_GEN_CRTL = 1

Display overscan is enabled if any of the overscan width values are non-zero. The left and right overscan widths are described in terms of pixels*8 and the top and bottom overscan widths are described in terms of vertical lines.

The overscan color is defined by an 8-bit index and a 24-bit color. In all display modes, the 24-bit color will be used by the internal RAMDAC and displayed on the monitor attached to the RAGE XL/XC. Note this is always a true color that is not mapped through the palette. The 8-bit index color is used in 4 bpp and 8 bpp modes for data going out on the 8-bit feature connector. The receiving board is expected to index all 4 bpp and 8 bpp data through its own palette.

b	R/W	OVR_CLR_G								Green overscan color (to internal DAC)																							
c	R/W	OVR_CLR_R								Red overscan color (to internal DAC)																							

Description

This register specifies the overscan color for the first display path.

Usage

This register should be touched only by the adapter BIOS when mode switching, or by the adapter installation program for overscan configuration.

4.2.5 GenLocking (CRT-Sync to Video) Registers

The GenLocking registers are used to indicate the *snapshot* values of the CRTC horizontal/vertical count, video frame and CRT frame count, captured automatically or manually. These values are used for calculating the frame rate drift between CRTC and Video frames, which in turn is used to reprogram PLL M and N (CLKBLK) to synchronize the frame rates.

		SNAPSHOT_VH_COUNTS																Offset: 1_1C															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		b																a

b	R	SNAPSHOT_HCOUNT																Snapshot of CRTC vertical count value															

		SNAPSHOT_F_COUNT																Offset: 1_1D															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																		a															
a	R	SNAPSHOT_F_COUNT																Snapshot of CRTC frame count value.															

NOTE: The following OVR2_* registers are NOT supported in RAGE XL/XC.

(NOT supported in RAGE XL/XC)

		SNAPSHOT2_VH_COUNTS																MM: 1_2C															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		b																a															
a	R	SNAPSHOT2_VCOUNT																Snapshot of second CRTC horizontal count value															
b	R	SNAPSHOT2_HCOUNT																Snapshot of second CRTC vertical count value															

(NOT supported in RAGE XL/XC)

		SNAPSHOT2_F_COUNT										MM: 1_2D																					
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												a																					
a	R	SNAPSHOT2_F_COUNT										Snapshot of second CRTC frame count value.																					

		N_VIF_COUNT										Offset: 1_1E																					
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												a																					
a	R/W	N_VIF_COUNT_VAL										Programmable N-Video-in-Field count value used to generate a snapshot interrupt when this N-count value is equal to the count value of the lower 10 bit SNAPSHOT_VIF_COUNT. Refer to CRTC_INT_CNTL [8:7] for the snapshot interrupt specification																					

Usage

This register is pre-programmed to non-zero 'N' of the Video-in-Field to capture count values automatically. When this non-zero N value is expired, an interrupt is triggered to indicate an auto-snapshot has been taken.

(NOT supported in RAGE XL/XC)

		N_VIF2_COUNT										MM: 1_2E																					
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												a																					
a	R/W	N_VIF2_COUNT_VAL										Programmable N-video-in-field count value which is used to generate a snapshot interrupt when this N-count value is equal to the count value of the lower 10-bit SNAPSHOT_VIF_COUNT. Refer to CRTC_INT_CNTL [8:7] for the snapshot interrupt specification																					

See also:

CRTC_INT_CNTL register (page 4-51), bits [8:7] - 0_06 for the snapshot interrupt specification.

		SNAPSHOT_VIF_COUNT											Offset: 1_1F																				
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
									d	c	b											a											
a	R	LSNAPSHOT_VIF_COUNT											Lower snapshot of Video_in_Field count value. (Lower 10 bits [9:0] indicate the current number of frames accumulated.)																				
b	R	USNAPSHOT_VIF_COUNT											Upper snapshot of Video_in_Field count value. (Upper 11 bits [20:10] indicate the current number of N-frames.)																				
c	R/W	AUTO_SNAPSHOT_TAKEN											0 = writing '0' enables both auto and manual snapshot taking and clears internal SNAPSHOT_F_COUNT and SNAPSHOT_VIF_COUNT counters (W). 1 = indicates that a snapshot has been taken (R)																				
d	W	MANUAL_SNAPSHOT_NOW											1 = snapshot taken immediately (writing '1' to this bit prevents all auto-snapshot taking until a write of '0' to the AUTO_SNAPSHOT_TAKEN bit which will re-enable the auto-snapshot taking.)																				

Usage

Use this register to calculate the total number of Video-in-Field frames. Use the following equation:

$$\text{Total VIF frame count} = (N_VIF_COUNT_VAL * USNAPSHOT_VIF_COUNT) + LSNAPSHOT_VIF_COUNT$$

(NOT supported in RAGE XL/XC)

		SNAPSHOT2_VIF_COUNT											MM: 1_2F																				
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
									c	b	a																						
a	R	SNAPSHOT2_VIF_COUNT											Snapshot of Video-in-field count value: Lower 10-bit [[9:0] indicates the current number of frames accumulated. Upper 11-bit [20:10] indicates the number of N-frames. Total frame count = (N_VIF2_COUNT_VAL x Upper SNAPSHOT2_VIF_COUNT) + Lower SNAPSHOT2_VIF_COUNT																				

Cont'd		SNAPSHOT2_VIF_COUNT																MM: 1_2F															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
										c	b	a																					
b	R/W	AUTO_SNAPSHOT2_TAKEN																0 = writing '0' enables both auto and manual snapshot taking, and clears SNAPSHOT2_F_COUNT and SNAPSHOT2_VIF_COUNT counters (W). 1 = indicates that a snapshot for second CRT has been taken (R)															
c	W	MANUAL_SNAPSHOT2_NOW																1 = Snapshot taken immediately (writing '1' to this bit prevents all auto-snapshot taking until a writing of '0' to the AUTO_SNAPSHOT2_TAKEN bit that will re-enable the auto-snapshot taking)															

4.2.6 Clock Control Registers

		CLOCK_CNTL																Offset: 0_24															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
										e				d	c				b					a									
a	R/W	CLOCK_SEL																Non-VGA mode video clock frequency select. In VGA mode clock select is determined by GENMO(3:2).															
b	R/W	PLL_WR_EN																Internal clock synthesizer (PLL) register write enable. 0 = PLL_DATA is read-only 1 = PLL_DATA is read/write															
c	R/W	PLL_ADDR																Selects register in internal clock synthesizer (PLL) to read or write.															
d	R/W	PLL_ADDR(5)																PLL register select bit 5															
e	R/W	PLL_DATA																Internal clock synthesizer (PLL) read/write data. See PLL_WR_EN.															

Description

This register selects a pixel clock in non-VGA modes. It is also used for programming the internal clock synthesizer (or PLL registers which are described next). The internal clock synthesizer has only 4 programmable pixel clock settings; therefore, only bits 0 and 1 of CLOCK_SEL are used.

Usage

This register should be touched only by the adapter BIOS when switching video modes.

- *Advanced Topics: Manual Mode Switching and Custom CRT Modes*
- *Appendix C: CRTIC Parameters*
- *Appendix D: Clock Chip Reference*

4.2.7 PLL Control Registers

The PLL registers are accessed indirectly through the CLOCK_CNTL register described above. Example reads and writes of the PLL registers are given below. The address CLOCK_CNTL0 represents bits 7:0, CLOCK_CNTL1 bits 15:8, and CLOCK_CNTL2 bits 23:16.

PLL Register Read

iow8 CLOCK_CNTL1 PLL_ADDR ; PLL address to read (PLL_WR_EN = 0)

ior8 CLOCK_CNTL2 PLL_DATA ; data is put into variable PLL_DATA

PLL Register Write

iow8 CLOCK_CNTL1 PLL_ADDR | PLL_WR_EN; PLL address to write and PLL_WR_EN = 1

iow8 CLOCK_CNTL2 PLL_DATA; PLL data to write

32 bit I/O write:

iow32 CLOCK_CNTL CLOCK_SEL | PLL_ADDR | PLL_WR_EN | PLL_DATA

Notes:

- PLL registers 0 and 1 control gain and duty cycle of analog PLLs. Gain bits affect lock and jitter of PLLs. These registers should only be adjusted by the BIOS.
- Oscillator is always turned on regardless of whether 14.3 or 29.5 MHz crystal is being used.
- All clock sources can be programmed to exceed the frequency limitations of the hardware. Do not attempt to program the PLL registers without a good understanding of the frequency limitations of all clock nets.
- PLL_TEST_CTRL and PLL_TEST_COUNT are used only during manufacturing tests of analog PLLs.

The table below is a listing of the PLL registers with their default values.

Table 4-6 PLL Register Default Values

Address	Register Name	Default	Default for Scan
0	MPLL_CNTL	ACh	ACh

e	R/W	MCLK_SRC_SEL		Select MCLK (MCLK is GUI and 3D Engine clock) 000 = MCLK set to PLLMCLK (MPLL primary output) 001 = MCLK set to PLLMCLK/2 010 = MCLK set to PLLMCLK/4 011 = MCLK set to PLLMCLK/8 100 = MCLK set to PLLMCLK/3 101 = MCLK set to CPUCLK 110 = MCLK set to SCLK HCLK (direct, no DLL) 111 = MCLK set to XTALIN					
f	R/W	DLL_PWDN		0 = Enable DLL 1 = Power down DLL (for full powerdown, set DLL_GAIN = 10)					

Description

This register sets up the PLL and DLL general controls, and MCLK source, and/or post divider selection (default = CFh).

MCLK_FB_DIV									Addr: 4
BITS	7	6	5	4	3	2	1	0	
	a								
a	R/W	MCLK_FB_DIV		MPPLL feedback divider (default = F6h, 50 MHz)					

Description

This register sets up the MPLL feedback divider.

Usage

MPLL output (PLLMCLK) will run at:

$$PLLMCLK = (XTALIN * x * MCLK_FB_DIV)/(PLL_REF_DIV)$$

where *x* is either 2 or 4 as set by MFB_TIMES_4_2b@PLL_EXT_CNTL

PLL_VCLK_CNTL									Addr: 5
BITS		7	6	5	4	3	2	1	0
		e		d		c	b	a

b	R/W	PLL_PRESET			1 = Reset VCLK PLL				
c	R/W	VCLK_INVERT			1 = Invert VCLK to get opposite duty cycle				
d	R/W	ECP_DIV			Set ECP (ECP is the Scaler/Ovelay clock) 00 = ECP set to VCLK 01 = ECP set to VCLK/2 10 = ECP set to VCLK/4 11 = Reserved				
e		(scratch)			Reserved for future use				

Description

This register sets up the pixel clock control (default = 04h).

Usage

Display will stop and the system will hang if anything is done to stop VCLK. Switch VCLK_SRC_SEL to another source before resetting or stopping PLLVCLK or XTALIN.

VCLK_POST_DIV									Addr: 6

c	R/W	VLCK2_POST		Lower bits of post divider for VCLK2					
d	R/W	VLCK3_POST		Lower bits of post divider for VCLK3					

Description

This registers sets up the lower bits of post dividers for VCLK 0-3 (default = 00h).

Usage

Post divider selection made by VGA_CKSEL@GENM0 in VGA mode (see page 7-23) or by CLOCK_SEL@CLOCK_CNTL (see page 4-68) in extended display modes.

VCLK0_FB_DIV									Addr: 7

BITS	7	6	5	4	3	2	1	0	
	a								
a	R/W	VCLK3_FB_DIV		Feedback divider for VCLK3 (default =65h)					

Description

This register sets up the VPLL feedback divider. Selection made by VGA_CKSEL@GENM0 in VGA mode (see page 7-23) or by CLOCK_SEL@CLOCK_CNTL (see page 4-68) in extended display modes.

Usage

VPLL output (PLLVCLK) will run at:

$$PLLVCLK = XTALIN * 2 * VCLKx_FB_DIV / PLL_REF_DIV$$

where VCLKx can be VCLK1, VCLK2 or VCLK3.

PLL_EXT_CNTL									Addr: 11

b	R/W	DLL_FB_SEL			Selection of source for DLL_FB_CLK 00 = DLL_FB_CLK set to HCLK input 01 = DLL_FB_CLK set to XCLK 10 = DLL_FB_CLK set to internal feedback 11 = Reserved				
c	R/W	DLL_RESET			DLL reset control. DLL resets on rising edge of this signal if DLL_REF_CLK is running				
d	R/W	HCLK_OUT_EN			0 = HCLK forced to tri-state 1 = HCLK output enabled				

Description

This register sets up the controls for XCLK DLL (default = 40h).

Usage

When using SDRAM/SGRAM, the DLL phase locks the external version of the memory clock to the internal XCLK.

		VFC_CNTL							Addr: 13
BITS		7	6	5	4	3	2	1	0
		f		e	d		c	b	a

c	R/W	EXT_VPLL_FB_DIV		EXT_VPLL_FB_DIV bits [10:8]				

Description

This register sets up the most significant bits (msb) of EXT_VPLL_REF_DIV and EXT_VPLL_FB_DIV (default = 00h).

HTOTAL_CNTL									Addr: 29	
BITS		7	6	5	4	3	2	1	0	
		c			b			a		
a	R/W	PLLCLK_SLIP			Reserved, not yet implemented Number of 1/5th of PLLCLK periods to extend HTOTAL by. Valid range is 0 to 4, for 5 or more increment VCLK_POST_SLIP.					
b	R/W	VCLK_POST_SLIP			Reserved, not yet implemented Number of periods of PLLCLK to extend each HTOTAL by stopping VCLK post divider. For corrections equal to or greater than the current post divider use the TVO_H_TOT_PIX register.					
c	R/W	HTOTAL_CNTL_VGA_EN			Reserved, not yet implemented 0 = No HTOTAL control through this register in VGA modes. 1 = Enable HTOTAL control through this register in VGA modes.					

Description

This register controls sub-pixel adjustment of HTOTAL timing. TVO_CNTL register controls active edge of HSYNC and HTOTAL adjustment down to pixel level. Update of this register does not take effect until opposite edge of HSYNC than specified in TVO_H_TOT_EDGE register to ensure atomic change of each slip field outside active area (default = 00h).

BYTE_CLK_CNTL									Addr: 30	
BITS		7	6	5	4	3	2	1	0	
		c			b			a		
a	R/W	BYTE_CLK_SKEW			Selects BYTE_CLK phase in 1/2 PLLCLK increments. Valid range depends on BYTE_CLK_POST_DIV, and may not exceed (2 * byte clock post divider)-1. e.g. for byte clock post divider of 3 (BYTE_CLK_POST_DIV = 10), then (2*3) - 1 = 5, so BYTE_CLK_SKEW has range 0 to 5					

BYTE_CLK_CNTL									Addr: 30
BITS	7	6	5	4	3	2	1	0	
			c	b		a			
b	R/W	BYTE_CLK_POST_DIV		TV out byte clock post divider. If VCLK for TV out clock sourced in ImpacTV then set to 00, otherwise VCLK for TV out sourced from internal PLL and post dividers are changed as indicated 00 = BYTE_CLK set to GPIO(11) input, no change in VCLK_POST_DIV 01 = BYTE_CLK set to PLLVCLK/2, multiply VCLK_POST_DIV by 2 10 = BYTE_CLK set to PLLVCLK/3, multiply VCLK_POST_DIV by 3 11 = BYTE_CLK set to PLLVCLK/4, multiply VCLK_POST_DIV by 4					
c	R/W	BYTE_CLK		0 = BYTE_CLK from ImpacTV to graphics controller 1 = Forces BYTE_CLK to be muxed out BYTCLK pin to ImpacTV					

Description

This register controls the byte clock sent to (or received from) ImpacTV and extra VCLK post divider. VCLK_SRC_SEL must be set to 10 for BYTE_CLK generation (default = 00h).

(NOT supported in RAGE XL/XC)

d	R/W	SS_EN			Enable spread spectrum clocking Allows to broadband the VCLK source frequency for reducing measured EMI				

Description:

This register sets up the control of PM_XCLK and PM_YCLK for dynamic memory clock speed power management (default 55h).

4.2.8 DAC Control Registers

The DAC_REGS are also addressed at VGA I/O addresses 3C6h to 3C9h (not in the order below), i.e., the same palette data and DAC_MASK are used either in VGA or in extended modes.

		DAC_REGS																Offset: 0_30															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		d								c								b				a											
a	R/W	DAC_W_INDEX								DAC write index register * Indexes the 256x24 entry palette RAM for write operations.																							
b	R/W	DAC_DATA								DAC data register * If DAC is in 6-bit mode then two MSB are ignored on write, zero on read. If DAC is in 8-bit mode, then two LSB are ignored on write, zero on read. DAC WRITE: First 8 bit write is red data, next two writes are green and blue, respectively. After blue write the 24 bit palette is updated and DAC_W_INDEX auto-increments to next index. DAC READ: After DAC_R_INDEX is written, three reads from DAC_DATA will give red, green and blue color components, respectively. After every third read the next index in the palette is read automatically and the read index is auto-incremented.																							
c	R/W	DAC_MASK								DAC mask register * This 8 bit mask value is ANDed with the incoming 8 bit pseudocolor pixel data. The resultant value is used for looking up the true color in the LUT.																							
d	W	DAC_R_INDEX								DAC read index register * Indexes the 256x24 entry palette RAM for read operations.																							

Description

This register is actually a group of four 8-bit registers (not a single 32-bit register) aliased to the VGA DAC registers DAC_MASK (3C6), DAC_R_INDEX (3C7), DAC_W_INDEX (3C8) and DAC_DATA (3C9). See the *mach64 VGA Register Guide* for more details.

Byte accesses are recommended over word or Dword accesses. These registers may also be accessed in accelerator mode through the VGA I/O addresses if DAC_VGA_ADR_EN@DAC_CNTL is set.

Usage

Use these registers to reprogram the DAC look up table (LUT).

n	R	DAC_TYPE																Select DAC type 000 = Internal DAC, 18-bit palette, no gamma correction 001 = Internal DAC, 24-bit palette, gamma correction 010 - 111 = Reserved															

Description

This register configures the on-chip DAC interface unit. If the DAC has extended address bits to access extended DAC registers, then those upper address bits will be specified in DAC_EXT_SEL. DAC_8BIT_EN selects between 8-bit or 6-bit modes, and is used only if both modes are supported.

To enable CRT monitor auto-detection through hardware, set CRT_DETECTION_ON = 1.

For manual detection of the CRT monitor through software, set MONITOR_DET_EN@LCD_MISC_CNTL = 1.

To properly use the bits for selecting either manual- or auto-detection of the CRT monitor, set the following bits to their proper values:

```
FORCE_DAC_DATA_SEL@LCD_MISC_CNTL
FORCE_DAC_DATA@LCD_MISC_CNTL
```

Usage

This register is used only for mode switching. Only the adapter BIOS touches this register.

Chapter 5

GUI Draw Engine

5.1 Draw Engine Trajectory Registers

This chapter describes the GUI engine registers. Operations are initiated implicitly by writing to DST_WIDTH or DST_BRES_LNTH. X and Y coordinates are in the range -8192 to +8191 and -16384 to +16383 respectively. All drawing operations are orthogonal with respect to pixel size. Packed 24 bpp is partially supported by setting DST_PIX_WIDTH to 8 bpp and adjusting the x coordinates and scissor values. The DST_24_ROT_EN and DST_24_ROT control bits allow for a full 24 bpp foreground color, background color, and write mask, which will be rotated properly by the GUI engine. In addition, the 8x8x1 monochrome pattern source will be expanded and rotated properly. Note that Bresenham line drawing operations are not generally supported in the partial 24 bpp mode.

Note: Draw Engine registers are visible only in the memory space, not in sparse or block I/O.

5.1.1 Destination Trajectory Registers

This register has two names—DST_BRES_DEC or LEAD_BRES_DEC

		DST_BRES_DEC (LEAD_BRES_DEC)																		MM: 0_4B													
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																		a															
a	R/W	DST_BRES_DEC										Bresenham decrement for line and trapezoid leading edge																					

Description

This register is a signed 18-bit register that stores the Bresenham line decrement term. The number loaded into this register must be negative. This term is added to the DST_BRES_ERR term whenever the Bresenham error is positive.

Usage

Use this register for line draw or trapezoid draw operations. It is aliased as LEAD_BRES_DEC.

																		a														
a	R/W	DST_BRES_ERR											Bresenham error term for line and trapezoid leading edge																			

Description

This register is a signed, 18-bit register that stores the Bresenham line error term. If the error term is negative, an axial step is taken and DST_BRES_INC is added to this register; otherwise, a diagonal step is taken in the direction of the major axis, and DST_BRES_DEC is added.

Usage

Use this register for line draw or trapezoid draw operations. It is aliased as LEAD_BRES_ERR.

o	R/W	BRES_SIGN_AUTO																Bresenham sign 0 = Zero error term is defined by DST_BRES_SIGN and TRAIL_BRES_SIGN bit 1 = Overrides DST_BRES_SIGN and TRAIL_BRES_SIGN bit. Zero error term is positive for X Major lines whose Y_DIR is 0 or for Y Major Lines whose X_DIR is 0. For Trapezoids with sub-pixel addressing, this bit is changed to include pixels on the top/left of the triangle																								
p	R/W	ALPHA_OVERLAP_ENB																Allow a pipeline optimization to fetch data for the current triangle before the previous triangle has been written to memory. If the triangles do in fact overlap in the frame buffer, this runs the risk of blending with the wrong data. 0 = Disallow optimization (guarantees correct blend) 1 = Allow optimization (risks incorrect data during triangle overlap)																								
q	R/W	SUB_PIX_ON																This forces the interpretation of BRES_LNTH, DST_X, DST_Y and TRAIL_X as having 2 bits of sub-pixel precision This bit is valid only for Trapezoid trajectories It also changed the interpretation of BRES_SIGN_AUTO																								

Description

This register describes the miscellaneous control bits for the destination area:

If the destination trajectory is rectangular, DST_X_DIR and DST_Y_DIR will determine the trajectory quadrant that the destination area and the source area will take. Rectangular areas are always X-major.

If the destination trajectory is a line, DST_X_DIR, DST_Y_DIR, and DST_Y_MAJOR will determine the trajectory octant that the destination line will take and the source area direction is specified in SRC_LINE_X_DIR@SRC_CNTL. Source areas are always rectangular. Source areas do not advance in the Y direction when destination trajectory is a line.

DST_X_TILE and DST_Y_TILE affect only rectangular destinations. These bits determine the side effect of the DST_X and DST_Y registers after the draw operation is completed. If DST_X_TILE is set, then DST_X will be assigned DST_X+DST_WIDTH upon draw completion for a left-to-right draw operation (DST_X-DST_WIDTH for right-to-left); otherwise DST_X is unchanged.

Similarly, if `DST_Y_TILE` is set, then `DST_Y` will be assigned `DST_Y+DST_HEIGHT` upon draw completion (for a top-to-bottom draw operation (`DST_Y_DST_HEIGHT` for bottom-to-top); otherwise `DST_Y` is unchanged).

`DST_LAST_PEL` affects only destination line trajectories. When set, the last pixel in the line is drawn, otherwise it is not. This register does *not* affect `DST_X` and `DST_Y` trajectories.

`DST_POLYGON_EN` affects line and rectangle destinations differently. (1) For lines, with this bit set, only one pixel will be drawn per scan line (with the exception of horizontal lines, where no pixels will be drawn). Lines exceeding the left scissor boundary will be saturated to the left scissor. (2) For rectangles, with this bit set, an implicit polygon source (specified by the source trajectory registers) is used to conduct an alternate-fill polygon fill on the destination. Blit sources cannot be used in conjunction with polygon fills. `DST_X_DIR` must be set to left-to-right operation for correct polygon fill behavior.

`DST_24_ROT_EN` and `DST_24_ROT` are used to set the initial rotation factor in packed 24 bpp mode.

`DST_BRES_SIGN` controls the behavior of the line draw engine when `DST_BRES_ERR` is zero. When set, a zero error term is considered negative, otherwise it is positive.

Usage

This register must be set for all draw operations. `DST_Y_MAJOR` and `DST_LAST_PEL` are applicable only for line draw operations. `DST_X_TILE` and `DST_Y_TILE` are applicable only for rectangle fills.

BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		b												a																			
a	R/W	DST_OFFSET												Destination offset address in terms of 64 bit words For SGRAM configuration, DST_OFFSET must be aligned on a 64 byte boundary																			
b	R/W	DST_PITCH												Destination pitch in pixels*8. Note that for monochrome modes the destination pitch must be a multiple of 64 pixels For SGRAM configuration, DST_PITCH must be a multiple of 64 bytes																			

Description

This register specifies the offset (in QWORDS) and pitch (in pixels) of the destination area. If the memory boundary is enabled, ensure that the offset points to an area above or equal to the boundary. If the destination is on-screen memory, any value of pitch smaller than the display area is not meaningful.

Usage

This register should be set for all draw operations.

BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		b																a															
a	R/W	DST_WIDTH																Destination width Only bits [13:0] are used for rectangle draws Bit [15] is write ONLY and will always read back as '0' Bits [15:14] are aliased to DST_BRES_LENGTH[15:14] and are used for trapezoid draw operations															
b	W	DST_WIDTH_FILL_DIS																Disables initiation of rectangular fill operations 0 = Rectangular fill operation initiated 1 = No rectangular fill operation initiated NOTE: This function is performed when the register is written. The bit is not stored, or read															

Description

This register specifies the width in pixels of a rectangular destination area and initiates a draw operation. DST_WIDTH can be set without initiating a draw operation by setting the DST_WID_FILL_DIS bit.

Writing to this register also overwrites the contents of DST_BRES_LNTH.

Usage

Use this register only for drawing a rectangular destination area.

		Z_OFF_PITCH																MM: 0_52															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		b												a																			
a	R/W	Z_OFFSET												Z offset address in terms of 64 bit words																			
b	R/W	Z_PITCH												Z pitch (*8)																			

Description

This register is used to specify the offset (in QWORDS) and pitch (in pixels) of the Z-buffer area. The Z-buffer destination will always track the normal destination in X and Y, but with its own pitch and offset.

(*8) means the unit value (in decimal) contained in the bits represents 8 pixels.

Example: to set the pitch of the Z-buffer area to 16 pixels, insert 02h (i.e., 2 decimal) into bits [19:0]; therefore, 2*8 = 16.

Usage

Use this register for all 3D draw operations.

All other Z functions directly track the DST registers.

l	R/W	SRC_8x8x8_BRUSH_LOADED																Holds current 8x8x8 brush for next brush operation 0 = Load new brush 1 = Hold 8x8x8 brush from previous operation Note: SRC_8x8x8_BRUSH must be set to '1' for this bit to have effect															

Cont'd		SRC_CNTL																MM: 0_6D															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																		n	m	l	k	j	i	h	g	f	e	d	c	b	a		
m	R/W	COLOR_REG_WRITE_EN																Enable color register blit for SGRAM Not needed when auto-color register updates are enabled (see HW_DEBUG) Write as 0															
n	R/W	BLOCK_WRITE_EN																Enable block write blit using SGRAM color register Not needed if auto-block-writes are enabled (see HW_DEBUG). Write as '0'															

Description

This register contains various enable bits for blit source trajectory control.

SRC_PATT_EN, SRC_PATT_ROT_EN, and SRC_LINEAR_EN are set as shown in the table below to select the source trajectories as follows:

Table 5-1 Source Trajectories vs SRC_CNTL Enable Bits

SRC_LINEAR_EN	SRC_PATT_ROT_EN	SRC_PATT_EN	Source Trajectory
1	0	0	Strictly Linear
0	0	0	Unbounded Y
0	0	1	General Pattern
0	1	1	General Pattern with Rotation

SRC_BYTE_ALIGN is applicable only when the destination is rectangular. In 1 bpp mode, if this field is set, the source pointer will advance to the nearest byte boundary when the destination advances in the Y direction.

SRC_LINE_X_DIR is applicable only when the destination is a line. It is used to specify the source direction.

Source and destination trajectory directions are de-coupled for line draws. The source is always rectangular, but never advances in the Y direction for lines.

For SRC_8x8x8_BRUSH, the SRC_LINEAR_EN must be set as well. The source pixel depth should be set to 8Bpp and the source in DP_SRC should be set the 'Blit Source' in order for the 8x8x8 brush to be used.

For BUS_MASTER_OP = 2 (Foreground register to system memory), all 32-bits of the foreground register are always transferred to system memory. Thus, prior to setting

the bus master to this mode, the desired color to be transferred must be replicated in all 32-bits of the foreground color register if the current GUI pixel depth is < 32Bpp.

For block write operations, the following apply:

- The color register must be written qword-aligned.
- There are no restrictions on the alignment of operations (i.e., DST X), except that DST_OFF_PITCH must be 64 byte aligned and DST_PITCH must be a multiple of 64 bytes in pixel depth.
- Pixel depths of 8/16/32 bpp are fully supported (not 24 bpp).
- Fastfill bit must be set.

Usage

Use this register only if a blit source is selected in the pixel data path.

5.2 Draw Engine Control Registers

5.2.1 Host Data Registers

The host data registers provide pixel data that are used in the current drawing operation. The pixel data may be used as a monochrome or color pixel source. For rectangular drawing operations, the pixel data may be either packed from one horizontal line to the next or unpacked. All registers are treated identically and data is fed to the engine in the order in which it is written to any of the host data registers. Up to sixteen host data registers are provided to allow block data moves of variable length up to the depth of the parameter FIFO.

		HOST_DATA[15:0]																MM: 0_80 – 0_8F															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		a																															
a	W	HOST_DATA[i]																Host data register – pixel data taken from the least significant bit, nibble, byte, or word for left-to-right rectangular drawing operations; and taken from the most significant bit, nibble, byte, or word for right-to-left rectangular drawing operations. Data for line drawing operations are always taken from the least significant bit, nibble, byte, or word See DP_BYTE_PIX_ORDER@DP_PIX_WIDTH for more details on monochrome mode.															

Description

This register is actually a single register mapped to 16 consecutive addresses, thus the notation HOST_DATA[15:0]. This scheme enables applications to conduct high speed host transfers using REP MOVSD. The register corresponds directly to the host data source in the pixel data path.

If a draw operation expects host data and any other draw engine register is written, the draw operation will *panic* and complete the draw operation with a garbage color. This condition is interruptible through BUS_CNTL.

If HOST_DATA is written and host data is not expected, the data is discarded.

Full FIFO discipline must be applied to this register; that is, check the FIFO before doing a REP MOVSD.

Usage

Data is fed to the draw engine through a host source by repeatedly writing pixel data to this register. Under certain conditions, it may be more desirable to write directly to the big linear aperture instead of using the host data port.

When using HOST_DATA for 3D operations (either shading or texture mapping), the data is not allowed to be packed. That is, only a single pixel at a time is sent to the host data register. The pixel will be assumed to be aligned to bit 0. The DP_SCALE_PIX_WIDTH rather than the DP_HOST_PIX_WIDTH field will determine the size of the data.

		HOST_CNTL																MM: 0_90															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																												b	a				
a	R/W	HOST_BYTE_ALIGN																Enables byte aligning the host data															
b	R/W	HOST_BIG_ENDIAN_EN																Enables big endian data translation for 15 bpp, 16 bpp, and 32 bpp pixel width. In 15 bpp and 16 bpp modes the bytes within each word are swapped. In 32 bpp mode the order of the four bytes within each dword is reversed 0 = Disable big endian data translation 1 = Enable big endian data translation															

Description

HOST_BYTE_ALIGN controls the host data consumption for 1 bpp data. When T_BYTE_ALIGN is enabled and the destination trajectory advances in the Y direction,

pixels are consumed from the host data port until the nearest byte boundary is reached. When host data byte align is not enabled, pixel data is packed.

Usage

HOST_BIT_ENDIAN_EN controls the endians of the HOST_DATA register. This register is used only if a data path source is set to host data, and host data pixel width is 1 bpp.

5.2.2 Pattern Registers

Two pattern registers (PAT_REG0 and PAT_REG1) support three fixed destination aligned pattern modes: monochrome 8x8, 8bpp color 4x2, and 8bpp color 8x1. For the VT/GT-B, 8x8x8 patterns or brushes can be using a linear source in conjunction with the SRC_8x8x8_BRUSH@SRC_CNTL. For all patterns, the alignment of register data to the least significant bits of DST_X and DST_Y is as follows:

Table 5-2 Data Alignment (Monochrome 8x8x1, DP_BYTE_PIX_ORDER = 0)

5.2.3 Scissors

The scissor registers define the rectangular region within which data is drawn. Left and right scissor registers are within the range -8192 to +8191. Top and bottom scissor registers are within the range -16384 to +16383. Polylines which follow a trajectory to the left of the left scissor register will result in a line drawn along the left scissor coordinate.

5.2.4 Data Path Registers

		DP_BKGD_CLR																MM: 0_B0															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		a																															
a	R/W	DP_BKGD_CLR																Background color															

Description

This register is used to hold a solid color source. The number of bits used varies depending on graphics modes, as follows:

Table 5-6 Video Modes vs Bits Used

Video Mode	Bits Used
1 bpp	The least significant bit
8 bpp	The least significant 8 bits
15 bpp/16 bpp	The least significant 16 bits
packed 24 bpp	The least significant 24 bits
32 bpp	All 32 bits

Usage

Generally, use this register for the background source in a color expansion of monochrome data.

		a																															
a	R/W	DP_FRGD_CLR																Foreground color															

Description

This register holds a solid color source. The number of bits used varies depending on graphics modes, as follows:

Table 5-7 Video Modes vs Bits Used

Video Mode	Bits Used
1 bpp	The least significant bit
8 bpp	The least significant 8 bits
15 bpp/16 bpp	The least significant 16 bits
packed 24 bpp	The least significant 24 bits
32 bpp	All 32 bits

Usage

Generally, use this register for solid color fill or for the foreground source in a color expansion of monochrome data.

The register (DP_FOG_CLR) is used to source the solid **Fog** color.

		a																															
a	R/W	DP_WRITE_MSK																Write mask															

Description

This register inhibits the destination writing of selected bits within a pixel. Each occurrence of a zero in the mask will preserve the content of the destination pixel at that bit position in the pixel. The bits used vary according to the video mode used as shown in [Table 5-7 on page 43](#)

Usage

All draw operations require this register to be set.

When Alpha Blending is enabled, the Destination Read FIFO is unavailable to the 2D engine. This register **must** be set to 0xFFFFFFFFh.

1	R/W	DP_SCALE_PIX_WIDTH																Scaler source and 3D (texture and shading) datapath pixel width 0000 = Reserved 0001 = Reserved 0010 = 8 bpp pseudocolor 0011 = 15 bpp aRGB 1555 0100 = 16 bpp RGB 565 0101 = (reserved) 0110 = 32 bpp aRGB 8888 0111 = 8 bpp RGB8 332 1000 = Y8 greyscale 1001 = RGB8 greyscale (8 bit intensity, duplicated for all three channels, Green channel is used on writes) 1010 = Reserved 1011 = YUV 422 packed (VYUY) 1100 = YUV 422 packed (YVYU) 1101 = (reserved) 1110 = aYUV444 (8:8:8:8) 1111 = 16 bpp aRGB 4444															

Description

This register specifies the pixel format of the destination area, blit source area, and host data register. Although each may be specified independently, the only pixel format conversions supported are 1 bpp to any pixel size when doing color expansion of monochrome data.

DP_BYTE_PIX_ORDER affects pixel ordering within a byte of data for 1 bpp mode. This bit affects the pixel order when writing to destination memory or reading from blit source memory. It also affects the interpretation of the HOST_DATA register.

If the display mode is 4 bpp, this field should be set to the same value as CRTC_BYTE_PIX_ORDER@CRTC_GEN_CNTL. These bits should be set only once upon mode initialization.

Usage

Use this register for setting draw engine pixel width and pixel ordering within a byte. The source, host, and destination pixel widths may be specified separately, although only the following combinations are supported for simple color sources:

Table 5-8 Host Destination Pixel Width Combinations

Supported Pixel Widths	
Host or Source Pixel Width	Destination Pixel Width
1	1
1	8
1	15
1	16
1	32
8	8
15	15
16	16
32	32

Note that 8 bpp pseudo-color, Y8, and 8 bpp RGB332 are treated as raw 8 bpp data by the standard draw engine, and are differentiated from one another by the Scaler/3D block, which needs to pack expanded 24 bpp pixels into their respective destination pixel formats.

Also, YUV422 is treated as raw 32 bpp data by the standard draw engine, and is differentiated by the Scaler/3D block.

When using the Scaler/3D pipeline, the following combination of scaler source and destination pixel formats may be selected:

Table 5-9 Scalar Pipe Pixel Conversions

Scaler Source Pixel Width	Destination Pixel Widths
Pseudo 8	Pseudo 8
Y8	RGB8, 15, 16, 32, Y8, YUV422, YUV444
Pseudo 8 or Y8	RGB 8, 15, 32*
RGB 8	RGB 8, 15, 16, 32
RGB 12	RGB 8, 15, 16, 32
RGB 15	RGB 8, 15, 16, 32
RGB 16	RGB 8, 15, 16, 32
RGB 32	RGB 8, 15, 16, 32
YUV422	RGB8, 15, 16, 32, Y8, YUV422, YUV444
YUV444	RGB8, 15, 16, 32, Y8, YUV422, YUV444

* This combination is only available during Texture Mapping or Scaling. The Pseudocolor-to-RGB conversion is done via a read of the texture palette.

		DP_MIX																MM: 0_B5															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												b				a																	
a	R/W	DP_BKGD_MIX										Background mix (see table below)																					
b	R/W	DP_FRGD_MIX										Foreground mix (see table below)																					

Description

This register specifies the ALU mix function for both foreground and background expansions. If the result of the monochrome pixel consumption is zero, then the ALU uses DP_BKGD_MIX for that pixel; otherwise, DP_FRGD_MIX is used.

Table 5-10 Mix Function Descriptions

Mix Function	Description
0h	(not DST)
1h	"0"
2h	"1"
3h	DST
4h	(not SRC)
5h	DST xor SRC
6h	(not DST) xor SRC
7h	SRC
8h	(not DST) or (not SRC)
9h	DST or (not SRC)
Ah	(not DST) or SRC
Bh	DST or SRC
Ch	DST and SRC
Dh	(not DST) and SRC
Eh	DST and (not SRC)
Fh	(not DST) and (not SRC)
10h-1Fh	Reserved

Usage

Always set this register. DP_BKGD_MIX is 'don't_care' for non-trivial color expansion of monochrome data. A non-trivial monochrome source is anything but *Always_'1'*.

Note that when Alpha Blending or Anti-Aliasing is enabled, the Destination Read FIFO is unavailable to the 2D engine. In this case, DP_MIX **must not** use the Destination.

		DP_SRC																MM: 0_B6															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																		c						b						a			
b	R/W	DP_FRGD_SRC																Foreground source – bit descriptions same as those for DP_BKGD_SRC[2:0], shown above															
c	R/W	DP_MONO_SRC																Monochrome source 0 = '1' 1 = Pattern registers 2 = Host data 3 = Blit source															

Description

This register controls the mono mux and the two color muxes in the pixel data path.

Usage

DP_FRGD_SRC and DP_MONO_SRC are required to be set for all draw operations. DP_BKGD_SRC is *don't_care* for non-trivial color expansion of monochrome data. A non-trivial monochrome source is anything but *Always_1*.

5.2.5 Color Compare Registers

The color compare function allows color keying on destination or source color values. Note that the color comparison function is not supported in 1 bpp mode.

When color keying on the texel source, the key is compared against the expanded (24 bit) source. When color keying 8 bit pseudo color sources, the source data is located on the low order 8 bits.

		CLR_CMP_CLR																MM: 0_C0

		a																															
a	R/W	CLR_CMP_CLR																Color comparison color															

Description

This register is compared against the source or destination data to determine whether the source data will overwrite the destination data.

Usage

Use this register only when CLR_CMP_FN@CLR_CMP_CNTL is set to a non-trivial compare function.

b	R/W	CLR_CMP_SRC																Defines source for color keying 00 = Destination 01 = 2D Source 10 = Texel Source/Scaler Source 11 = Reserved															

Description

This register configures the source or destination compare logic.

CLR_CMP_SRC determines whether the CLR_CMP_CLR register is to be compared against the source or the destination data. When CLR_CMP_SRC is '1', Auto Fastfill must be disabled.

CLR_CMP_FN determines the compare function. If the result of the comparison is false, the color source data is written to the destination; otherwise destination data is written to the destination.

Setting CLR_CMP_FN to any function other than FALSE or TRUE when CLR_CMP_SRC is set for destination keying will automatically cause the destination operation to be read-modify-write.

Usage

Use this register for selectively inhibiting the drawing of certain pixels which key on the source data or destination data.

5.2.6 Command FIFO Registers

The command FIFO is ‘n’ words deep by 32 bits, where n > 16. For the RAGE XL/XC, n = 64, 256, or 512 as determined by CMD_FIFO_SIZE_MODE@GUI_CNTL.

FIFO_STAT																MM: 0_C4																	
BITS	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
																a																	
a	R	FIFO_STAT																Register represents the occupancy of the last 16 entries in the FIFO, regardless of the actual total FIFO depth															

Description

Reading FIFO_STAT returns the status of the command FIFO. Any occurrence of a ‘1’ in the FIFO_STAT field indicates that the corresponding FIFO entry is filled. Writing to the command FIFO when insufficient entries are available will cause the FIFO_ERR bit to go high and lock the draw engine. This circumstance should never occur. An interrupt may be wired to the FIFO_ERR bit for debugging purposes through

BUS_CNTL. The draw engine may reset the error condition through GEN_TEST_CNTL.

Only registers with DWORD indices greater than or equal to 0x40 go through the command FIFO. All other registers bypass the FIFO.

Usage

Each grouping of register writes through the command FIFO must be preceded by a FIFO check to ensure that sufficient entries are available.

p	R/W	SRC_PATT_ROT_EN																Enable pattern source rotation SRC_X_START, SRC_Y_START will only be used if this bit is enabled															
q	R/W	SRC_LINEAR_EN																Enable the source to be advanced linearly in memory The source starts at SRC_OFFSET and advances in the left-to-right direction. DST_X_DIR should also be set to the left-to-right to operate properly Note that all other source registers and control bits with the exception of SRC_BYTE_ALIGN are ignored															
r	R/W	SRC_BYTE_ALIGN																Allows the source to skip to the next data byte boundary when the destination advances in the Y direction SRC_LINEAR_EN must be set															
s	R/W	SRC_LINE_X_DIR																Source X direction when drawing operation is a bresenham line															
t	R/W	SRC_8x8x8_BRUSH																Treats source as an 8x8x8 linear brush (SRC must be QWORD aligned)															
u	R/W	FAST_FILL_EN																Fast filling for transparent DST Not needed if auto-fast-fills are enabled (see HW_DEBUG) Write as '0'															
v	R/W	SRC_TRACK_DST																Source will track the trajectory that the DST FIFO is using															
w	R/W	PAT_MONO_EN																Enable monochrome 8x8 pattern															
x	R/W	PAT_CLR_4x2_EN																Enable color 4x2 pattern															
y	R/W	PAT_CLR_8x1_EN																Enable color 8x1 pattern															
z	R/W	HOST_BYTE_ALIGN																Enable byte alignment of the host data															
aa	R/W	HOST_BIG_ENDIAN_EN																Enable big endian data translation for 15 bpp, 16 bpp, and 32 bpp pixel widths. In 15 bpp and 16 bpp modes, the bytes within each word are swapped. In 32 bpp mode, the order of the four bytes within each DWORD is reversed. 0 = Disable big endian data translation 1 = Enable big endian data translation															

Description

This register is a composite of registers DST_CNTL, SRC_CNTL, PAT_CNTL, and HOST_CNTL.

Usage

Use this register for general draw operations.

See Also

5.2.8 Draw Engine Status Registers

		GUI_STAT																MM: 0_CE															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		f																e	d	c	b	a											
a	R	GUI_ACTIVE																Indicates that the GUI engine is busy															
b	R	DSTX_LT_SCISSOR_LEFT																Indicates DST_X is left of left scissor															
c	R	DSTX_GT_SCISSOR_RIGHT																Indicates DST_X is right of right scissor															
d	R	DSTY_LT_SCISSOR_TOP																Indicates DST_Y is above top scissor															
e	R	DSTY_GT_SCISSOR_BOTTOM																Indicates DST_Y is below bottom scissor															
f	R	GUI_FIFO																Indicates the number of free DWORDS remaining in the FIFO. (the default value is determined by CMDFIFO_SIZE_MODE@GUI_CNTL)															

Description

This register reports the status of the draw engine.

Usage

The GUI_ACTIVE bit determines whether the draw engine is busy or idle. All status bits in this register should be read-only when the draw engine is idle.

Chapter 6

Host Interface

6.1 PCI Configuration Space Registers

The RAGE XL/XC is optimized to support the PCI local bus and to implement the PCI Configuration Space registers. A brief description of the registers with their byte addresses is given below (for detailed descriptions please refer to the *PCI Local Bus Specification*).

PCI configuration reads and writes may be in 8, 16, or 32 bits. A 32-bit read of byte address 0, for example, would read the four bytes 0 to 3.

DEVICE ID BGA (RAGE XL) PKGBGAb = 0	DEVICE ID PQFP (RAGE XC) PKGBGA = 1	Description
GR (4752h)	GS (4753h)	PCI 33MHz, 3.3V Signaling
GR (4752h)	GS (4753h)	PCI 33MHz, 5V Signaling
GO (474Fh)	GL (474Ch)	PCI 66MHz
GM (474Dh)	GN (474Eh)	AGP 1X, 2X

VENDOR_ID																Byte Addr: 1:0

d	R/W	IDCT																0 = Data for command FIFO (i.e. guiengine, eng_3d) 1 = Data for IDCT															

Including the following register:

		BM_DATA																MM: 0_92															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		a																															
a	W	GUIREG_DATA																Data for register at offset specified by BM_ADDR															

Description

BM_ADDR determines the 8-bit memory mapped offset for the desired GUI register. BM_DATA is used to write the 32-bit data.

Usage

The BM_ADDR/DATA register is dual-purpose. Note that the BM_ADDR/DATA register is mapped to the same address intentionally to support this type of bus mastering operation. Upon the first write, the address of the desired GUI register is loaded into BM_ADDR. This is an 8-bit address defined by the memory-mapped (MM) offset designated for the register. Only GUI registers in block zero can be loaded in this manner. The second write (to BM_DATA) permits the 32-bit data written to be loaded into the specified register. After this write, the BM returns to address mode to await an the next register address.

Writing any register except BM_ADDR will reset BM_ADDR/DATA to address mode.

This register is extremely useful for transferring a list of register setup information from system memory using the bus master. Simply set up memory as a series of alternating register offset/data pairs (2 DWORDS per pair) and initiate a bus master operation (system -> frame) that transfers the data in this list to the BM_ADDR register. Ensure that the frame buffer offset points to the BM_ADDR/DATA register and the FRAME_OFFSET_HOLD bit is set in the BM_COMMAND DWORD entry for the current descriptor.

b	R/W	GUI_TABLE_ADDR																Physical address [31:4] in system memory for start of GUI Descriptor Table															

Usage

The GUI_TABLE_ADDR will wrap when it internally reaches a 16KB, 32KB, 64KB, or 128KB boundary (according to its circular buffer size).

		BM_GUI_TABLE_CMD																MM: 0_93															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		b																												a			
a	R/W	CIRCULAR_BUF_SIZE																00 = 16KB (1K entries) 01 = 32KB (2K entries) 10 = 64KB (4K entries) 11 = 128KB (8K entries)															
b	R/W	GUI_TABLE_ADDR																Physical address [31:4] in system memory for start of GUI Descriptor Table															

Usage

BM_GUI_TABLE_CMD is an alias for BM_GUI_TABLE. The distinction is that BM_GUI_TABLE_CMD goes through the GUI command FIFO and is thus synchronized to the command stream.

6.3 AGP Registers

		AGP_BASE																MM: 1_52

b	R/W	MAX_IDLE_CLK																Number of clocks (MAX_IDLE_CLK times 32) that the AGP block will wait before stopping the generation of the 2X sideband strobe after it no longer has a request to service: (default = 0, disabled)																	
c	R/W	HIGH_PRIORITY_READ_EN																1 = Generate all read as high priority reads 0 = Generate all read at their default priority (default)																	
d	R/W	AGP_TRDY_MODE																0 = DATA comes in clock after TRDY sampled 1 = DATA comes in clock in which TRDY sampled (default)																	

Chapter 7

VGA-Compatible Registers

7.1 VGA Compatible Registers Summary – By I/O Port

VGA registers in the RAGE XL/XC are fully hardware-compatible with registers in the IBM VGA video adapter. They are grouped and described in details on the pages as indicated in the table below.

Table 7-1 Register Functional Classes

Register Classes	Page
CRT Controller Registers (GRAxx)	7-5
Attribute Controller Registers (ATTRxx)	7-17
General Status and Configuration Registers (GENxx)	7-22
Sequencer Registers (SEQxx)	7-25
DAC Registers (DACxx)	7-29
Graphics Controller Registers (GRAxx)	7-30

Also, for convenience, they are listed by I/O port address (and by index) in table 9-2 on the next three pages.

Note:

under the Port column:

? = B when

[0]=0 (Monochrome emulation).

? = D when GENMO[0]=1 (Color/Graphics emulation).

Table 7-2 VGA Compatible Registers Reference List

The following sections describe the registers grouped under the six register classes mentioned earlier. **I/O** indicates the read and write address of the register, and **Index** is included if the register is accessible indirectly.

7.2 VGA CRT Controller Registers

In the I/O address, note that:

? = B when GENMO[0]=0 (Monochrome emulation).

? = D when GENMO[0]=1 (Color/Graphics emulation).

		CRTC_INDEX (CRTX)					I/O: 3?4	INDEX:–		
BITS		7	6	5	4	3	2	1	0	
		a								
a	R/W	VCRTC_IDX[5:0]			This index points to one of the internal registers of the CRT controller (CRTC) at address 3?5h, for the next CRTC read/write operation These registers are described on the following pages					

		HORIZONTAL_TOTAL (CRT00)					I/O: 3?5	INDEX: 00		
BITS		7	6	5	4	3	2	1	0	
		a								
a	R/W	H_TOTAL[7:0]			These bits define the active horizontal display in a scan line, including the retrace period The value is five less than the total number of displayed characters in a scan line					

		HORIZONTAL_DISPLAY_ENABLE_END (CRT01)					I/O: 3?5	INDEX: 01		
BITS		7	6	5	4	3	2	1	0	
		a								
a	R/W	H_DISP_END[7:0]			These bits define the active horizontal display in a scan line The value is one less than the total number of displayed characters in a scan line					

START_HORIZONTAL_BLANKING (CRT02)	I/O: 3?5	INDEX: 02
--	-----------------	------------------

BITS	7	6	5	4	3	2	1	0
	a							
a	R/W	H_BLANK_START[7:0]		These bits define the horizontal character count that represents the character count in the active display area plus the right border In other words, the count is from the start of active display to the start of triggering of the H blanking pulse				

END_HORIZONTAL_BLANKING (CRT03)	I/O: 3?5	INDEX: 03
--	-----------------	------------------

BITS	7	6	5	4	3	2	1	0
	c	b		a				
a	R/W	H_BLANK_END[4:0]		H Blanking End bits [4:0] respectively These are the five low-order bits (of six bits in total) of horizontal character count for triggering the end of the horizontal blanking pulse The sixth bit is CRT05[7] The character count is equal to the sum of "H blanking start" plus "H blanking pulse width"				
b	R/W	H_DE_SKEW[1:0]		Display Enable Skew 00 = Zero-character-clock skew 01 = One-character-clock skew 10 = Two-character-clock skew 11 = Three-character-clock skew				
c	R/W	CR10CR11_R_DISB		Compatibility Read: 0 = Enable write-only to CRT10 and CRT11 1 = Enable read/write access to both vertical retrace start/end register CRT10 and CRT11				

START HORIZONTAL RETRACE (CRT04)									I/O: 3?5	INDEX: 04
BITS	7	6	5	4	3	2	1	0		
	a									
a	R/W	H_SYNC_START[7:0]			These bits define the horizontal character count at which the horizontal retrace pulse becomes active					

END_HORIZONTAL_RETRACE (CRT05)									I/O: 3?5	INDEX: 05	
BITS	7	6	5	4	3	2	1	0			
	c	b		a							
a	R/W	H_SYNC_END[4:0]			H Retrace Ends bits These are the 5-bit result from the sum of CRT04 plus the width of the horizontal retrace pulse in character clock units						
b	R/W	H_SYNC_SKEW[1:0]			H Retrace Delay bits 00 = Zero character clocks 01 = One character clock 10 = Two character clocks 11 = Three character clocks These two bits skew the Horizontal Retrace pulse						
c	R/W	H_BLANK_START[5]			H Blanking End bit [5] This is bit 5 of the 6-bit character count for the H blanking end pulse The other five low-order bits are CRT03[4:0]						

VERTICAL_TOTAL (CRT06)									I/O: 3?5	INDEX: 06
BITS	7	6	5	4	3	2	1	0		
	a									
a	R/W	V_TOTAL[7:0]			These are the eight low-order bits of the 10-bit vertical total register The two high-order bits are CRT07[5:0] in the CRTC overflow register. The value of this register represents the total number of H raster scans plus vertical retrace (active display, blanking), minus two scan lines					

		CRTC_OVERFLOW (CRT07)				I/O: 3?5		INDEX: 07	
BITS		7	6	5	4	3	2	1	0
		h	g	f	e	d	c	b	a
a	R/W	V_TOTAL[8]			V Total bit [8] (CRT06) Bit 8 of 10-bit vertical count for V Total (for functional description, see CRT06 register)				
b	R/W	V_DISP_END[8]			End V Display bit [8] (CRT12) Bit 8 of 10-bit vertical count for V Display enable end (for functional description, see CRT12 register)				
c	R/W	V_SYNC_START[8]			Start V Retrace bit [8] (CRT10) Bit 8 of 10-bit vertical count for V Retrace start (for functional description, see CRT10 register)				
d	R/W	V_BLANK_START[8]			Start V Blanking bit [8] (CRT15) Bit 8 of 10-bit vertical count for V Blanking start (for functional description, see CRT15 register)				
e	R/W	LINE_CMP[8]			Line Compare bit [8] (CRT18) Bit 8 of 10-bit vertical count for Line Compare (for functional description, see CRT18 register)				
f	R/W	V_TOTAL[9]			V Total bit [9] (CRT06) Bit 9 or 10-bit vertical count for V Total (for functional description, see CRT06 register)				
g	R/W	V_DISP_END[9]			End V Display bit [9] (CRT12) Bit 9 of 10-bit vertical count for V Display Enable End (for functional description, see CRT12 register)				
h	R/W	V_SYNC_START[9]			Start V Retrace bit [9] (CRT10) Bit 9 of 10-bit vertical count for V Retrace start (for functional description, see CRT10 register)				

		PRESET_ROW_SCAN (CRT08)				I/O: 3?5		INDEX: 08	
BITS		7	6	5	4	3	2	1	0
			b		a				
a	R/W	ROW_SCAN_START[4:0]			This register is used for software-controlled vertical scrolling in text or graphics modes The value specifies the first line to be scanned after a V retrace (in the next frame) Each H Retrace pulse increments the counter by '1', up to the Maximum Scan Line value programmed by CRT09, then the counter is cleared				

PRESET_ROW_SCAN (CRT08)									I/O: 3?5	INDEX: 08			
BITS	7	6	5	4	3	2	1	0					
		b		a									
b	R/W	BYTE_PAN[1:0]			Byte Panning Control bits [1] and [0] respectively Bits [6] and [5] extend the capability of byte panning (shifting) by up to three characters (for description, see H PEL Panning register ATTR13)								

MAXIMUM_SCAN_LINE (CRT09)									I/O: 3?5	INDEX: 09			
BITS	7	6	5	4	3	2	1	0					
	d	c	b	a									
a	R/W	MAX_ROW_SCAN[4:0]			Maximum Scan Line bits These bits define a value that is the actual number of scan line per character minus one								
b	R/W	V_BLANK_START[9]			Start V Blanking bit [9] (CRT15) Bit 9 of 10-bit vertical count for V Blanking start (for functional description, see CRT15 register)								
c	R/W	LINE_CMP[9]			Line Compare bit [9] (CRT18) Bit 9 of 10-bit vertical count for line compare (for functional description, see CRT18 register)								
d	R/W	DOUBLE_CHAR_HEIGHT			200-/400 Line Scan 0 = Counter is incremented per scan line 1 = Clock pulses to the row scan counter are divided by two. Effectively, this allows the line in 200-line mode to be displayed twice before the row scan counter is incremented once NOTE: H/V display and blanking timings etc. (in CRT00-CRT06 registers) are not affected by these bits								

		CURSOR_START (CRT0A)					I/O: 3?5	INDEX: 0A	
BITS		7	6	5	4	3	2	1	0
		b			a				
a	R/W	CURSOR_START[4:0]			<p>Cursor Starts bits [4:0], respectively</p> <p>These bits define a value that is the starting scan line (on a character row) for the line cursor. The five-bit value is equal to the actual number minus one. This value is used together with Cursor End bits CRT0B [4:0] to determine the height of the cursor</p> <p>The cursor height in VGA does not wrap around (as in EGA) and is actually absent when the 'end' value is less than the 'start' value. In EGA when the 'end' value is less, the cursor is a full block cursor which is the same height as the character cell</p>				
b	R/W	CURSOR_DISABLE			<p>Cursor On/Off</p> <p>0 = Cursor on</p> <p>1 = Cursor off</p>				

		CURSOR_END (CRT0B)					I/O: 3?5	INDEX: 0B	
BITS		7	6	5	4	3	2	1	0
		b			a				
a	R/W	CURSOR_END[4:0]			<p>Cursor End bits[4:0], respectively</p> <p>These bits define the ending scan row (on a character line) for the line cursor. In EGA, this 5-bit value is equal to the actual number of lines plus one</p> <p>The cursor height in VGA does not wrap around (as in EGA) and is actually absent when the 'end' value is less than the 'start' value. In EGA when the 'end' value is less, the cursor is a full block cursor which is the same height as the character cell</p>				
b	R/W	CURSOR_SKEW[1:0]			<p>Cursor Skew bits [1] and [0], respectively</p> <p>These bits define the number of characters the cursor is to be shifted to the right (skewed) from the character pointed at by the cursor location (registers CRT0E and CRT0F), in VGA mode. Skew values when in EGA mode are enclosed in brackets</p> <p>00 = Zero (zero) character skew</p> <p>01 = One (zero) character skew</p> <p>10 = Two (one) character skew</p> <p>11 = Three (two) character skew</p>				

START_ADDRESS (HIGH BYTE) (CRT0C)									I/O: 3?5	INDEX: 0C	
BITS	7	6	5	4	3	2	1	0	a		
a	R/W	DISP_START[15:8]			SA bits [15:8] These are the eight high-order bits of the 16-bit display buffer start location. The low order bits are contained in CRT0D In split screen mode, CRT0C + CRT0D points to the starting location of screen A (top half). The starting address for screen B is always '0'						

STAR_ADDRESS (LOW BYTE) (CRT0D)									I/O: 3?5	INDEX: 0D	
BITS	7	6	5	4	3	2	1	0	a		
a	R/W	DISP_START[7:0]			SA bits [7:0] These are the eight low-order bits of the 16-bit display buffer start location. The high-order bits are contained in CRT0C. In split screen mode, CRT0C + CRT0D points to the starting location of screen A (top half.) The starting address for screen B is always 0.						

CURSOR_LOCATION (HIGH BYTE) (CRT0E)									I/O: 3?5	INDEX: 0E	
BITS	7	6	5	4	3	2	1	0	a		
a	R/W	CURSOR_LOC[15:8]			CA bits [15:8] These are the eight high-order bits of the 16-bit cursor start address. The low-order CA bits are contained in CRT0F. This address is relative to the start of physical display memory address pointed to by CRT0C + CRT0D. In other words, if CRT0C + CRT0D is changed, the cursor still points to the same character as before						

CURSOR_LOCATION (LOW BYTE) (CRT0F)									I/O: 3?5	INDEX: 0F
BITS		7	6	5	4	3	2	1	0	
		a								
a	R/W	CURSOR_LOC[7:0]			CA bits [7:0] These are the eight low-order bits of the 16-bit cursor start address. The high-order CA bits are contained in CRT0E This address is relative to the start of physical display memory address pointed to by CRT0C + CRT0D. In other words, if CRT0C + CRT0D is changed, the cursor still points to the same character as before					

START_VERTICAL_RETRACE (CRT10)									I/O: 3?5	INDEX: 10
BITS		7	6	5	4	3	2	1	0	
		a								
a	R/W	V_SYNC_START[7:0]			Bits CRT10 [7:0] are the eight low-order bits of the 10-bit vertical retrace start count The two high-order bits are CRT07 [2:7], located in the CRTC overflow register These bits define the horizontal scan count that triggers the V retrace pulse					

This register is read/write enabled if CRT03[7] is set to one. It is write-only enabled if CRT03[7] is set to zero.

END_VERTICAL_RETRACE (CRT11)									I/O: 3?5	INDEX: 11
BITS		7	6	5	4	3	2	1	0	
		e	d	c	b	a				
a	R/W	V_SYNC_END[3:0]			V Retrace End bits [3:0] Bits CRT11[0:3] define the horizontal scan count that triggers the end of the V Retrace pulse					
b	R/W	V_INTR_CLR			V Retrace Interrupt Set 0 = V Retrace interrupt cleared					

END_VERTICAL_RETRACE (CRT11)									I/O: 3?5	INDEX: 11
BITS	7	6	5	4	3	2	1	0		
	e	d	c	b	a					
c	R/W	V_INTR_EN			V Retrace Interrupt Disabled 0 = Enable V Retrace interrupt					
d	R/W	SEL_5RFRSH			Reserved					
e	R/W	C0T7_WR_ONLY			Write Protect (CRT00-CRT06) 0 = Enable normal read/write of CRT00 to CRT07 1 = Write-protect registers CRT00 to CRT07 when in VGA mode as follows: all register bits except CRT07[4] are write-protected					

This register is read/write enabled if CRT03[7] is set to one. It is write-only enabled if CRT03[7] is set to zero.

VERTICAL_DISPLAY_ENABLE_END (CRT12)									I/O: 3?5	INDEX: 12
BITS	7	6	5	4	3	2	1	0		
	a									
a	R/W	V_DISP_END[7:0]			These are the eight low-order bits of the 10-bit register containing the horizontal scan count indicating where the active display on the screen should end The high-order bits are CRT07 [1:6] in the CRT overflow register					

OFFSET (CRT13)									I/O: 3?5	INDEX: 13
BITS	7	6	5	4	3	2	1	0		
	a									
a	R/W	DISP_PITCH[7:0]			These bits define an offset value, equal to the logical line width of the screen (from the first character of the current line to the first character of the next line) Memory organization is dependent on the video mode. Bit CRT17[6] selects byte or word mode. Bit CRT14[6], which overrides the byte/word mode setting, selects Double-Word mode when it is logical one The first character of the next line is specified by the start address (CRT0C + CRT0D) plus the offset. The offset for byte mode is 2x CRT13; for word mode, 4x; for double word mode, 8x					

UNDERLINE_LOCATION (CRT14)									I/O: 3?5	INDEX: 14		
BITS	7	6	5	4	3	2	1	0				
		c	b	a								
a	R/W	UNDRLN_LOC[4:0]			H Row Scan Bits [4:0] These bits define the horizontal scan row, from the top of the character line, that should be used for underlining. The 5-bit value is equal to the actual number minus one							
b	R/W	ADDR_CNT_BY4			Count-by-4 0 = Character clock is used unmodified at the memory address counter for byte addressing 1 = Character clock is divided-by-4 at the clock input to the Memory address counter. Count-by-4 clocks are used for double-word addressing. This bit overrides Addr_Cnt_By2 bit CRT17[3]							
c	R/W	DOUBLE_WORD			Double-Word Mode 0 = Allows addressing mode to be selected by CRT17[6] 1 = Enable double-word addressing mode. This bit overrides byte/word bit CRT17[6]							

START_VERTICAL_BLANKING (CRT15)									I/O: 3?5	INDEX: 15	
BITS	7	6	5	4	3	2	1	0			
	a										
a	R/W	V_BLANK_START[7:0]			Eight low-order bits of the 10-bit vertical blanking start register. Bit 9 is CRT09[5]; bit 8 is CRT07[3] The 10 bits specify the starting location of the vertical blanking pulse, in units of horizontal scan lines. The value is equal to the actual number of displayed lines minus one						

END_VERTICAL_BLANKING (CRT16)									I/O: 3?5	INDEX: 16	
BITS	7	6	5	4	3	2	1	0			
a	R/W	V_BLANK_END[7:0]			<p>These bits define the point at which to trigger the end of the vertical blanking pulse (the location is specified in units of horizontal scan lines)</p> <p>The value to be stored in this register is the seven low-order bits of the sum of "pulse width count" plus the content of Start Vertical Blanking register (CRT15) minus one</p>						

CRT_MODE (CRT17)									I/O: 3?5	INDEX: 17	
BITS	7	6	5	4	3	2	1	0			
	g	f	e		d	c	b	a			
a	R/W	RAO_AS_A13b			<p>Compatibility Mode</p> <p>0 = Substitutes row scan counter bit 0 as bit 13 of CRTC output during active display time. For example, this allows for compatibility with the 6845 controller or CGA APA modes</p> <p>1 = Enable row scan counter bit 13 as bit 13 of CRTC output</p>						
b	R/W	RA1_AS_A146			<p>Select Row Scan Counter</p> <p>0 = Selects row scan counter bit 1 (RA1) as bit 14 at the CRTC output during active display time. This substitution allows for compatibility with Hercules graphics and other 400-line graphics modes</p> <p>1 = Elects row scan counter bit 14 (RA14) as bit 14 at the CRTC output</p>						
c	R/W	VCOUNT_BY2			<p>Vertical_by_2</p> <p>0 = Increments the vertical timing counter every horizontal retrace</p> <p>1 = Increments the vertical timing counter every two horizontal retrace pulses. It effectively doubles the vertical resolution by two, for example, to 2048 horizontal scan lines in VGA and 1024 in EGA</p> <p>NOTE: When bit 2 is logical one, other vertical register values should be adjusted as well (CRT06, CRT10, CRT12, CRT15, and CRT18)</p>						
d	R/W	ADDR_CNT_BY2			<p>Count_by_2</p> <p>0 = Increments the memory address counter for every character clock</p> <p>1 = Increments the memory address counter for every two character clocks</p>						

Cont'd		CRT_MODE (CRT17)				I/O: 3?5	INDEX: 17		
BITS		7	6	5	4	3	2	1	0
		g	f	e		d	c	b	a
e	R/W	WRAP_A15toA0			Address Wrap 0 = Indicates only 64K video memory is to be addressed. In word mode, address counter bits are left-shifted once, so bit 13 (MA13) is wrapped around to bit 0 position at the CRTc output 1 = Enable 256K video memory addressing. In word mode, address counter bits are rotated left by one, so bit 15(MA15) is wrapped around to bit 0 position at the CRTc output				
f	R/W	BYTE_MODE			Byte/Word Mode 0 = Selects word mode memory addressing. The memory address is rotated left by one 1 = Selects byte mode memory addressing				
g	R/W	CRTc_SYNC_EN			H/V Retrace Enable 0 = Disable horizontal and vertical retrace 1 = Enable horizontal and vertical retrace				

640x200 mode is programmed for 100 horizontal scan lines with two row scan addresses per character row. Odd scan lines are offset in the display memory by 8K bytes.

		LINE_COMPARE (CRT18)				I/O: 3?5	INDEX: 18		
BITS		7	6	5	4	3	2	1	0
		a							
a	R/W	LINE_CMP[7:0]			These bits are the eight low-order of the 10-bit line compare register Bit [8] is CRT07[4], bit [9] is CRT09[6]. The value of this register is used to disable scrolling on a portion of the display screen, as when the split screen is active. When the vertical counter reaches this value, the memory address and row scan counters are cleared The screen area above the line specified by this register is commonly called screen A. The screen below is screen B. Screen B cannot be scrolled, but it can panned together with screen A, controlled by the PEL panning compatibility bit ATTR10[5]. For a description of this control bit, see ATTR10[5]				

GRAPHICS_CONTROLLER_INDEX DECODE (CRT1E,1F)									I/O: 3?5	INDEX:1E,1F
BITS	7	6	5	4	3	2	1	0		
	a									
a	R	GRPH_DEC[8:0]			This register is used to read back the graphics controller index decode					

RAM_DATA_LATCH_READBACK (CRT22)									I/O: 3?5	INDEX: 22
BITS	7	6	5	4	3	2	1	0		
	a									
a	R	GRPH_LATCH_DATA[7:0]			This register is used to read the data in the Graphics Controller CPU data latches The Graphics Controller Read Map Select register bits [0] and [1] determines which byte is read back					

7.3 VGA Attribute Controller Registers

Notes:

After initialization, OUT commands toggle between writing to the ATTRX and the indexed Attribute registers.

The Attribute registers operate with the Palette registers to establish the video DAC PEL definition.

		ATTR_INDEX (ATTRX)				I/O: 3C0		INDEX:--	
BITS		7	6	5	4	3	2	1	0
		b			a				
a	R/W	ATTR_IDX[4:0]			ATTR Index bits [4:0] This index points to one of the internal registers of the attribute controller (ATTR) at addresses 3C1h/3C0h, for the next ATTR read/write operation Since both the index and data registers are at the same I/O port, a pointer to the registers is necessary. This pointer can be initialized to point to the index register by a read instruction to the GENS1 register				
b	R/W	ATTR_PALRW_ENB			Palette Address Source 0 = Allows the processor to load the color palette registers 1 = Allows memory data to access the color palette registers After loading the color palette, this bit should be set to logical one				

		PALETTE 00-0F (ATTR00_0F)				I/O: 3C1(R) 3C0(W)		INDEX: 00 to 0F	
BITS		7	6	5	4	3	2	1	0
		a							
a	R/W	ATTR_PAL[5:0]			Color bits [5:0] These bits map the text attribute or graphic color input value to a display color on the screen. Color is disabled for those bits that are set to logical zero, enabled for those bits set to logical one				

Notes:

1. The two high-order bits of a 6-bit palette register content are stored in ATTR14[3:2].
2. Color bits 4 and 5 are substituted by ATTR14[1:0] when color source select ATTR10[7] is logical one.
3. In all modes except 256-color mode, pre-mapped 4-bit pixel values are used as addresses into the 16 ATTR palette registers. These internal registers allow 16 colors to be displayed simultaneously. The actual color output is the content of these registers.
4. In 256-color mode, where 256 colors can be displayed simultaneously, these registers are used only to index into the external registers, also called the DAC color table, where the color output values are stored.
5. Modification of these 16 internal palette registers enables the user to access 64 different addresses in the DAC color table.

		MODE_CONTROL (ATTR10)				I/O: 3C1(R) 3C0(W)		INDEX: 10	
BITS		7	6	5	4	3	2	1	0
		g	f	e		d	c	b	a
a	R/W	ATTR_GRP_MODE			Graphics/*Alphanumeric Mode 0 = Selects A/N (alphanumeric mode) 1 = Selects APA (graphics mode)				
b	R/W	ATTR_MONO_EN			Monochrome/*Color Attributes Select 0 = Selects color display 1 = Selects monochrome display				
c	R/W	ATTR_LGRP_EN			Line Graphics Enable 0 = Sets the ninth dot to the background color: mandatory for character fonts that do not use the line graphics character codes (C0h-DFh) 1 = Enable the special line graphics character codes for monochrome emulation, and sets the ninth dot of a line graphics character to be the same as the eighth dot				
d	R/W	ATTR_BLINK_EN			Blink Enable/*Background intensity 0 = Allows bit [7] of the character attribute to control background intensity 1 = Allows bit [7] of the character attribute to control blinking				
e	R/W	ATTR_PANTOPONLY			PEL Panning Compatibility 0 = Allows both halves of a split screen to pan together by preventing a line compare split screen function from affecting the output of PEL panning register ATTR13 and byte panning bits CRT08 [6:5] 1 = For panning only the top half of a split screen by forcing ATTR13 output to zero until the start of the next V sync pulse when line compare condition is "true"				
f	R/W	ATTR_PCLKBY2			PEL Clock Select 0 = Shift registers are clocked every dot clock 1 = For 256 color mode 13h: eight bits of video data are packed to form a pixel				
g	R/W	ATTR_CSEL_EN			Alternate Color Source 0 = Selects palette register bits [4] and [5] (in ATTR00-0F) as source for color output bits P4 and P5 1 = Selects ATTR14 [1:0] as source for color output bits P4 and P5, respectively				

OVERSCAN_COLOR (ATTR11)									I/O: 3C1(R) 3C0hW)	INDEX: 11
BITS	7	6	5	4	3	2	1	0		
									a	
a	R/W	ATTR_OVSC[7:0]			Overscan color					

Notes:

1. These bits define the color of the border (overscan) area in 80-column modes. Overscan borders are not supported in 40-column modes.
2. Refer to the description and notes for registers ATTR00-0F for information regarding how the color bits are substituted: bits 6 and 7, ATTR14[3:2], and bits 4 and 5, ATTR14[1:0].

COLOR_MAP_ENABLE (ATTR12)									I/O: 3C1(R) 3C0(W)	INDEX: 12
BITS	7	6	5	4	3	2	1	0		
			b			a				
a	R/W	ATTR_MAP_EN[3:0]			Enable color map bits [3:0] 0 = Disable data from maps 3-0 to be used for video output 1 = Enable data from a specific map, maps 3-0, to be used for video output					
b	R/W	ATTR_VSMUX[1:0]			Video Status Mux bits [0:1] These are control bits for the multiplexer on color bits P0-P7 The bit selection is also indicated at GENS1[5,4] as follows: 00 = P2, P0 01 = P5, P4 10 = P3, P1 11 = P7, P6					

HORIZONTAL_PEL_PANNING (ATTR13)									I/O: 3C1(R) 3C0(W)	INDEX: 13
BITS	7	6	5	4	3	2	1	0		
						a				
a	R/W	ATTR_PPAN[3:0]			Shift Count bits [3:0] The shift count value (0-8) indicates how many pixel positions to shift left (see table 9-3 below)					

Table 7-3 Left Shift vs Shift Count

COUNT VALUE	MODES 0+, 1+, 2+, 3+, 7, 7+	MODE 13	ALL OTHER MODES
0	1	0	0
1	2	-	1
2	3	1	2
3	4	-	3
4	5	2	4
5	6	-	5
6	7	3	6
7	8	-	7
8	0	-	-

Note: A/N modes 0+, 1+, 2+, 3+, and 7+ are enhanced modes with 9x16 box size resolution. A/N mode 7 has a 9x14 box size. APA mode 13 has a 320x200 screen resolution.

COLOR_SELECT (ATTR14)								I/O: 3C1(R) 3C0(W)	INDEX: 14
BITS		7	6	5	4	3	2	1	0
						b		a	
a	R/W	ATTR_CSEL[1:0]			Color bits P5 and P6, respectively These bits are the color output bits (instead of bits [5] and [4] of the internal palette registers ATTR00-0F) when alternate color source, bit ATTR10[7], is logical one				
b	R/W	ATTR_CSEL[3:2]			Color bits P7 and P6, respectively These two bits are the two high-order bits of the 8-bit color used for rapid color set switching (addressing different parts of the DAC color lookup table). The lower-order bits are in registers ATTR00-F				

7.4 General VGA Status and Configuration Registers

		VGA_SLEEP (GENVS)				I/O:102		INDEX:-	
BITS		7	6	5	4	3	2	1	0
									a
a	W	VGA_ENABLE2			VGA Sleep 0 = Disable VGA video subsystem (controller) The VGA video subsystem only responds to memory read operations to the BIOS ROM. All other I/O or memory read/write operations are suspended 1 = Enable VGA video Subsystem				

Notes:

- Writes to this register are controlled by GENENA[4].
- Example of enabling the VGA:

```

MOV DX, 46E8
MOV AL, 10
OUT DX, AL
MOV DX, 102
MOV AL, 1
OUT DX, AL
MOV DX, 46E8
MOV AL, 8
OUT DX, AL
                    
```

		FEATURE_CONTROL (GENFC)				I/O: 3CA(R) 3?A(W)		INDEX:-

BITS		7	6	5	4	3	2	1	0	
					b	a				
a	W	VGA_ENABLE0			VGA Enable 0 = Puts VGA video subsystem into sleep mode, during which the VGA video subsystem only responds to memory read operations to the BIOS ROM, and I/O writes to register 102h. All other I/O or video memory read/write operations are suspended 1 = Enable I/O and memory address decoding of VGA video subsystem, if GENVS[0] is also a logical one					
b	W	GENVS ENABLE			GENVS[0] Enable 0 = Disable I/O write to GENVS(0102) 1 = Enable I/O write to GENVS(0102)					

Note:

The decode of this register is optionally controlled by the PCI configuration space. Refer to *Chapter 8, PCI Configuration Registers*.

7.5 VGA Sequencer Registers

SEQUENCER_INDEX (SEQX)									I/O: 3C4	INDEX:-
BITS		7	6	5	4	3	2	1	0	
								a		
a	R/W	SEQ_IDX[2:0]			This index points to one of the sequencer registers (SEQ) at I/O port address 3C5h, for the next SEQ read/write operation These registers are described on the following pages					

		RESET (SEQ00)					I/O: 3C5	INDEX: 00	
BITS		7	6	5	4	3	2	1	0
								b	a
a	R/W	SEQ_RST0b			Synchronous Reset bit [0] 0 = Follows SEQ00[1] 1 = Allows the sequencer to run unless SEQ00[1] is zero				
b	R/W	SEQ_RST1b			Synchronous Reset bit [1] 0 = Disable character clock, and display requests to the video memory and H/V sync signals 1 = Allows the sequencer to run unless SEQ00[0] is zero				

Notes:

1. Bits 0 and 1 must both be zero (sequencer halted) before any clock select bits are changed; for example, clock selects GENMO[3:2] or SEQ01[0:3].
2. The SEQ00[0:1] bits must both be set to one for normal operation.

		CLOCK_MODE (SEQ01)					I/O: 3C5	INDEX: 01	
BITS		7	6	5	4	3	2	1	0
		e			d	c	b		a
a	R/W	SEQ_DOT8			8/9 Dot Clocks 0 = Selects 9-dot character clocks 1 = Selects 8-dot character clocks Modes 0, 1, 2, 3, 7 use 9-dot characters To change bit 0, GENVS[0] must be logical zero				
b, c	R/W	SEQ_SHIFT4 SEQ_SHIFT2			Shift 4, Shift Load bits 00 = Loads video serializers every character clock 01 = Loads video serializers every other character clock 10 = Loads video serializers every fourth character clock 11 = Loads video serializers every fourth character clock				
d	R/W	SEQ_PCLKBY2			Dot Clock 0 = Indicates dot clock is Master clock 1 = Indicates dot clock is Master clock divided by 2 Typically, 320 and 360 horizontal modes use divide-by-2 to provide 40 column displays. To change this bit SEQ00[0:0] must first be set to zero				
e	R/W	SEQ_MAXBW			0 = Allows CPU:CRT interleaved access to video memory 1 = Blanks the screen and disables video-generation logic access to video memory. Allows CPU uninterrupted access to video memory				

Note: To change this register, SEQ00[1 or 0] must first be logical zero.

		MAP_MASK (SEQ02)				I/O: 3C5		INDEX: 02	
BITS		7	6	5	4	3	2	1	0
						d	c	b	a
a	R/W	SEQ_MAP0_EN			Enable Map 0 0 = Disable write access to memory map 0 1 = Enable write access to memory map 0				
b	R/W	SEQ_MAP1_EN			Enable Map 1 0 = Disable write access to memory map 1 1 = Enable write access to memory map 1				
c	R/W	SEQ_MAP2_EN			Enable Map 2 0 = Disable write access to memory map 2 1 = Enable write access to memory map 2				
d	R/W	SEQ_MAP3_EN			Enable Map 3 0 = Disable write access to memory map 3 1 = Enable write access to memory map 3				

Notes:

1. In 4 bit per PEL graphics modes, when the value of this register is set to '1111' (0Fh), the processor can complete a 32-bit write operation in one memory cycle.
2. In text modes, the CPU only needs to access maps 0 and 1; therefore, this register should have a value of 03h.
3. When in odd/even modes, the map mask value for maps 0 and 1 should be same as the map mask value for maps 2 and 3.
4. Memory map updating such as bit map layering can be selectively enabled or disabled using bits in this register. For pixel-oriented operations, the graphics controller provides better control.

		CHARACTER_MAP_SELECT (SEQ03)				I/O: 3C5		INDEX: 03		
BITS		7	6	5	4	3	2	1	0	
					f	e	d	c	b	a
a, b, e	R/W	SEQ_FONTB[2:0]			Character Map Select B bits [2:0]					
c, d, f	R/W	SEQ_FONTA[2:0]			Character Map Select A bits [2:0]					

Notes:

1. The above register may seem unusual in the way that bits 1,0,4 and 3,2,5 are grouped. This is correct and the above notation is valid.
2. Extended memory SEQ04[1] must be logical in order to enable this select function; otherwise, the first 8K of map 2 is always selected.

VGA Sequencer Registers

3. Any changes made to this register take effect at the start of the next character line on the display.

*Bit Pattern	Map Selected	Offset into Map
0 0 0	0	0K
0 0 1	1	16K
0 1 0	2	32K
0 1 1	3	48K
1 0 0	4	8K
1 0 1	5	24K
1 1 0	6	40K
1 1 1	7	56K

		MEMORY_MODE (SEQ04)		I/O: 3C5	INDEX: 04															
BITS		3	2	1	0															
		c	b	a																
a	R/W	SEQ_256K	Extended Memory Indicates 256K of video memory is present. Also enables character map selection in SEQ03																	
b	R/W	SEQ_ODDEVEN	Odd/Even 0 = Uses the LSB CPU address bit A0 to select which memory map to access. Even CPU addresses access maps 0 and 2; odd addresses access maps 1 and 3 1 = Enable sequential access to video data maps for odd/even modes. Map Mask register bits SEQ02[0:3] identify which maps are to be accessed for each CPU address																	
c	R/W	SEQ_CHAIN	Chain 0 = Enable sequential data access within a bit map. Map Mask register bits SEQ02[0:3] identify which maps are to be accessed at any one time 1 = In 256 color modes, map select is by CPU address bits A0 and A1: <table border="1" style="margin-left: 40px;"> <thead> <tr> <th>A1</th> <th>A0</th> <th>Map Selected</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> </tr> <tr> <td>1</td> <td>0</td> <td>2</td> </tr> <tr> <td>1</td> <td>1</td> <td>3</td> </tr> </tbody> </table> When Chain is logical one, it takes priority over odd/even mode bits SEQ04[2] and GRA05[4]. Unlike odd/even mode, SEQ04[2] is the only bit used to enable chain mode (double odd/even) Chain does not affect CRTIC access to video memory Odd/even bit SEQ04[2] should be the opposite of GRA05[4]			A1	A0	Map Selected	0	0	0	0	1	1	1	0	2	1	1	3
A1	A0	Map Selected																		
0	0	0																		
0	1	1																		
1	0	2																		
1	1	3																		

7.6 VGA DAC Registers

		DAC_MASK (DAC_MASK)				I/O: 03C6		INDEX:--	
BITS		7	6	5	4	3	2	1	0
		a							
a	R/W	DAC_MASK			Participating bit positions in the mask for DAC lookup are set to one				

		DAC_READ_CURRENT_COLOR_INDEX (DAC_R_INDEX)				I/O: 03C7		INDEX:--	
BITS		7	6	5	4	3	2	1	0
		a							
a	R/W	DAC_R_INDEX			The current read index for a DAC operation - increments after every third read of DAC_Data (03C9) Refer to DAC_W_Index (03C8h)				

Note:

Only bit 0 of this register is readable. Writing the DAC at 03C8h results in a read-back value of 0. Writing the DAC at 03C7h results in a read-back value of 1.

		DAC_WRITE_CURRENT_COLOR_INDEX (DAC_W_INDEX)				I/O: 03C8		INDEX:--

		ENABLE_SET_RESET (GRA01)				I/O: 3CF		INDEX: 01	
BITS		7	6	5	4	3	2	1	0
						d	c	b	a
a	R/W	GRPH_SET_RESET_ENA[0]			Enable Set/Reset Map 0 0 = If write mode is 0 (GRA05[1:0]=0), CPU data is written to memory map 0 1 = If write mode is 0 (GRA05[1:0]=0), GRA00[0] is written to all eight bits of memory map 0				
b	R/W	GRPH_SET_RESET_ENA[1]			Enable Set/Reset Map 1 0 = If write mode is 0 (GRA05[1:0]=0), CPU data is written to memory map 1 1 = If write mode is 0 (GRA05[1:0]=0), GRA00[1] is written to all eight bits of memory map 1				
c	R/W	GRPH_SET_RESET_ENA[2]			Enable Set/Reset Map 2 0 = If write mode is 0 (GRA05[1:0]=0), CPU data is written to memory map 2 1 = If write mode is 0 (GRA05[1:0]=0), GRA00[2] is written to all eight bits of memory map 2				
d	R/W	GRPH_SET_RESET_ENA[3]			Enable Set/Reset Map 3 0 = If write mode is 0 (GRA05[1:0]=0), CPU data is written to memory map 3 1 = If write mode is 0 (GRA05[1:0]=0), GRA00[3] is written to all eight bits of memory map 3				

Note:

This register has no effect on data source select when the video memory map write mode is 1, 2, or 3.

		COLOR_COMPARE (GRA02)				I/O: 3CF		INDEX: 02		
BITS		7	6	5	4	3	2	1	0	
						a				
a	R/W	GRPH_CCOMP[3:0]			<p>Color Compare Map bits [3:0] In Read mode (GRA05[3] being logical one), the four bits from this register are compared with the 4-bit PEL value (made up of one bit from each map), from bit positions 0 to 7</p> <p>As long as the Color Don't care bits (GRA07[0:3]) for the respective maps are logical ones, the compare takes place only on those bits of the PEL value, and the CPU reads a one for a match in that bit position</p> <p>If the Color Don't Care bit for one map is logical zero, the latched data from the map is excluded from the compare, and only the remaining three bits are compared to generate the bus data</p>					

		DATA_ROTATE (GRA03)				I/O: 3CF		INDEX: 03	
BITS		7	6	5	4	3	2	1	0
						b		a	
a	R/W	GRPH_ROTATE[2:0]			<p>Rotate Count bits [2:0] Specifies the number of bit positions the CPU data is to be rotated to the right, before doing the function selected by bits 3 and 4 above and subsequent bit mask select and write operations</p> <p>Rotation is carried out only in write modes 0 and 3. In these two modes, the CPU data is rotated first, then operated on by the function bits GRA03 [4:3], then updated by the bit mask register GRA05</p>				
b	R/W	GRPH_FN_SEL[1:0]			<p>Function Select bits [1] and [2] 00 = CPU data replaces latched data 01 = CPU data ANDed with latched data 10 = CPU data ORed with latched data 11 = CPU data XORed with latched data</p> <p>These functions are performed on the CPU data before the selected bits are updated by the bit mask register, and then written to the display buffers</p>				

		READ_MAP_SELECT (GRA04)				I/O: 3CF	INDEX: 04		
BITS		7	6	5	4	3	2	1	0
								a	
a	R/W	GRPH_RMAP			Bits [1] and [2], respectively Read mode 0 only: GRA controller returns the contents of one of the four latched buffer bytes to the CPU each time a CPU read loads the latches These two bits ([0] and [1]) define a value that represents the bit map where the CPU is to read data - useful in transferring bit map data between the maps and system RAM				

Notes:

1. In Odd/Even modes, the value may be binary 00 or 01 for chained bit maps 0 and 1.
2. In mode 13h, where all maps are chained to form one map and in read mode 1, this register is ignored.

		GRAPHIC_MODE (GRA05)				I/O: 3CF	INDEX: 05		
BITS		7	6	5	4	3	2	1	0
		d			c	b	a		
a	R/W	GRPH_WRITE_MODE[1:0]		<p>Write mode</p> <p>00 = The CPU data byte can be written to video buffers map data latches in two dimensions</p> <ol style="list-style-type: none"> 1. Byte-oriented: to update any or all maps 2. Pixel-oriented: to update any or all eight pixels using predefined pixel value <p>Updates are controlled using values in the internal registers of this graphics controller, namely GRA00-GRA08. If enable set/reset bits are all zeros, CPU data updates the latches according to the function bits GRA03 [4:3], and each map is updated as masked by GRA08 [7:0]</p> <p>01 = Each map is written with the contents of its respective latches. These latches are loaded by a previous CPU memory read operation</p> <p>10 = Pixel-oriented: The four low-order bits of the CPU data are combined with the pixel values from the maps according to the functions specified by GRA03 [4:3], and each map is updated as masked by GRA08 [7:0]</p> <p>11 = Pixel-oriented, write mode 3 involves the following data manipulations:</p> <ol style="list-style-type: none"> 1. CPU data is rotated by GRA03 [2:0], then logical ANDed with the Bit Mask register bits GRA08 [7:0]. The result is an 8-bit mask for use in write mode 3, to determine which pixels (from step 2 below) are to be updated by the set/reset value, and which pixels are updated directly from the latches 2. The set/reset pixel values are produced as follows: The set/reset bits GRA00 [0:3] are compared with each pixel value from the latches according to function bits GRA03 [4:3] 					
b	R/W	GRPH_READ1		<p>Read Mode</p> <p>0 = Byte-oriented: The CPU reads the memory map specified by the Read Map Select Register GRA04 unless SEQ04 [3] is logical one (Chain). In the case where SEQ04[3] is logical one, CPU address bits [A0] and [A1] are used to read the specified memory map</p> <p>1 = Pixel-oriented, 4-bit value: The value is made up of one bit from each map. The CPU reads the result of the comparison of this pixel value ANDed with the 4-bit color compare register value. If a bit in the Color Don't Care register (GRA07) is zero, that bit position is excluded from the compare. A match causes that position in the byte to be read out by the CPU as a one. This process is repeated for all eight pixels</p>					
c	R/W	CGA_ODDEVEN		<p>Odd/Even Addressing Enable</p> <p>Used to enable CGA emulation, this bit enables the odd/even addressing mode when it is logical one. Normally this bit and memory mode bit SEQ04[2] are set to agree with each other in enabling odd/even mode emulation</p>

c	R/W	GRPH_XCARE[2]			Ignore Map 2				
d	R/W	GRPH_XCARE[3]			Ignore Map 3				

Notes:

1. A byte is latched from each memory map in a CPU read, mode 1. The color value of a pixel (PEL) is made up of a bit from each map. The 4-bit PEL value is ANDed with the four bits from this register.
2. Any bit (map x) indicated by a logical zero in this register causes the corresponding bit in the PEL value to exclude itself from the comparison with the color compare bits. The remaining bits are ANDed with the 4-bit color compare register, where a match produces a logical one for that bit position in the CPU data byte as read data.
3. For example, if register value is '1111', the entire 4-bit PEL value is compared with the color compare bits. If any bit position matches, a logical one in the corresponding bit position is generated as the CPU reads the data.

		BIT_MASK (GRA08)				I/O: 3CF		INDEX: 08	
BITS		7	6	5	4	3	2	1	0
		a							
a	R/W	GRPH_BMSK [7:0]			0 = Data is from latches. Logical zero in a bit position preserves the memory content of the four maps in the same bit position 1 = Data is from CPU byte. Logical one in a bit position allows updating of the four map bits that are in the same bit position. This register is used directly in write modes 0-2 only. Bit masking in write mode 3 involves the CPU data, which is described in register GRA05fs

Description

This register configures the LCD Engine in order to support different types of LCD panels.

Usage

LCD Engine configuration should be done in the adapter BIOS only and before LCD panel is turned on. Most of the parameters depend on the panel type that is connected to the Graphics Controller. Panel type can be detected by reading PANEL_ID field in the CONFIG_STAT0 register. Only the adapter BIOS should touch this register.

i	R/W	LP_VPOS_ADJUST3										Adjust position of the vsync during ratiometric expansion 00 = No shift 01 = Shift by 1 line 10 = Shift by 2 lines 11 = Shift by 3 lines																					

Description

This register configures the sync signals for dual-scan STN panels. This register has to be programmed only if dual-scan STN panel is used.

Usage

Dual-scan STN panel configuration should be done in the adapter BIOS only.

See Also

CONFIG_PANEL (fields PANEL_TYPE, PANEL_FORMAT) on [Chapter 8](#):

8.5 Half Frame Buffer Registers

(NOT supported in RAGE XL/XC)

		HFB_PITCH_ADDR																Offset: 0_2A Index: 3															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
														d	c					b	a												
a	R/W	XBUF_BASE												Base address of external frame buffer, bits 0XBUF_ADDRESS [22:15] This will put the half frame buffer on a 32K byte boundary in the physical memory																			
b	R/W	XBUF_SIZE												Defines the size of the half frame buffer in 32K increments 0000 = Size is unlimited 0001 - 1110 = Size in 32K blocks 1111 = Stop write to the half frame buffer unconditionally																			
c	R/W	CRT_SYNC_SEL												Defines which CRT values should be used in centering mode for CRT monitor. 0 = Use non-shadow values for CRT syncs in centering mode 1 = Use shadow (LCD) values for CRT syncs in centering mode																			
d	R/W	HFB_HW												Half frame buffer high watermark																			

Description

This register configures the external frame buffer inside LCD Engine. This register has to be programmed only if dual-scan STN panel is used.

Usage

External frame buffer configuration should be done in the adapter BIOS only and it is used only for dual-scan STN panels. Base address of the external frame buffer should be placed somewhere in off-screen memory. The memory size used for half frame could be calculated as:

$$\text{Memory_size [byte]} = \text{Horiz_resolution} \times \text{Vertical_resolution} \times 3/8$$

8.6 Horizontal and Vertical Stretching Registers

		HORZ_STRETCHING																Offset: 0_2A Index: 4															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		f	e	d	c								b				a																
a	R/W	HORZ_STRETCH_RATIO																<p>Horizontal stretch ratio</p> <p>The value in the register is shifted out serially. (the LSB first, i.e., bit [0]). If the bit that is shifted out is '0', the same pixel is duplicated. If the bit that is shifted out is '1', the next pixel is sent out. The bit [0] is looped back to either bit [9], [12], [14], or [15] depending on the value of the LOOP_STRETCH bit (bit [0] has to be programmed to zero). When HORZ_BLEND_EN is '1', HORZ_STRETCH_RATIO is used as a ratio for horizontal blender adder. In that case, only 12 least significant bits are used and the ratio should be:</p> $\text{HORZ_STRETCH_RATIO} = [\text{source_width}/\text{dest_width}] * 4096$															
b	R/W	LOOP_STRETCH																<p>Horizontal stretching shift register loop back select</p> <p>000 = Loop bit [0] back to bit [9] 001 = Loop bit [0] back to bit [11] 010 = Loop bit [0] back to bit [12] 011 = Loop bit [0] back to bit [14] 100 = Loop bit [0] back to bit [15] All others = Reserved</p>															
c	R/W	HORZ_PANEL_SIZE																Panel horizontal display in characters (pixels/8 – 1)															
d	R/W	AUTO_HORZ_RATIO																<p>Enable the calculation of horizontal stretch ratio based on actual horizontal display and overscan instead of H_DISP_END, OVR_WID_LEFT & OVR_WID_RIGHT registers</p> <p>0 = Disable auto horizontal stretch ratio 1 = Enable auto horizontal stretch ratio</p>															

		HORZ_STRETCHING																Offset: 0_2A Index: 4															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		f	e	d	c								b				a																
e	R/W	HORZ_STRETCH_MODE										Horizontal stretch mode 0 = Pixel replication (use shift register) 1 = Horizontal blending																					
f	R/W	HORZ_STRETCH_EN										Horizontal stretch enable 1 = Enable horizontal stretching																					

Description

This register defines the parameters for horizontal stretching (expansion).

Usage

In order to support ratiometric expansion, HORZ_STRETCHING, VERT_STRETCHING and EXT_VERT_STRETCH registers have to be programmed. The values that have to be programmed in these registers depend on the panel resolution and the current graphics mode resolution. Ratiometric expansion in horizontal direction can be done in two ways—pixel replication or blending.

Description

This register controls the Power Management features implemented in RAGE XL/XC.

Usage

Three different power saving modes are supported: *On*, *Standby* and *Suspend*, with the power consumption decreasing from *On* to *Suspend* mode.

		POWER_MANAGEMENT_2																Offset: 0_2A Index: 1D															
BITS		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
